CALIFORNIA

Type: ROUTINE INSPECTION

Date: 15-FEB-2024

### 3.125(a) Critical

#### Facilities, general.

In October of 2023, keepers found an senior, 24yo flying fox with its foot entangled in the mesh at the top of the enclosure upon arrival in the morning. A lift was necessary to free the animal from the mesh, but since it could not be moved into the enclosure, it was positioned as close as possible to the outside. Prior to freeing the animal from the mesh, it was assessed by staff. It was flapping its' wings and appeared to be strong. Based on that assessment, the decision was made, to avoid additional stress, to simply untangle the animal rather than cutting the mesh, capturing, and crating it. Crews were standing by, if necessary, to catch the animal in large blankets as he came down. Unfortunately, once freed, the flying fox impacted the roof of the public viewing area on the way down. He was immediately wrapped in a towel and brought into the night house for evaluation by veterinary staff. Due to the animal's presentation after the event, his advanced age, and the fact that he was already undergoing quality of life assessment for age related issues, the decision was made to have the animal humanely euthanized. Enclosures should be constructed with such material and such strength as to be appropriate for the animals housed within and to protect the animals from injury. Corrected prior to inspection.

In December of 2023, a 1yo Wallaroo was brought into the facility veterinary hospital with acute neurologic signs and a prior history of being uncharacteristically calm with a minimal flight distance. The animal received appropriate diagnostic testing and medical care. After almost 3 weeks in the veterinary hospital and an improvement in symptoms, the veterinary team decided to discharge the animal to a holding pen within the original habitat for monitoring and possible transition back into the habitat. Unfortunately, on the 3rd day of observation in the holding pen, the animal was found deceased, stuck in a gap between a sliding gate and the associated fencing. Enclosures should be constructed with such material and such strength as to be appropriate for the animals housed within and to protect the animals from injury. Correct by 2/28/24.

### 3.153(a)(1)(ii)

#### Primary enclosures.

In an outdoor enclosure, a red-tailed hawk had access to multiple unprotected heat lamp cords and one extension cord that were plugged into live outlets. This could lead to potential electrocution and or injury if the bird were to damage the
