Type: ROUTINE INSPECTION
Date: 04-JUN-2014

3.125(a)

FACILITIES, GENERAL.

There are several areas in both fox enclosures where these animals have dug exposing the wire mesh. This has now created holes underneath which now pose a risk of injury or entrapment. One of the foxes "Cheza" has had a previous injury to one of the legs resulting in temporarily injury/lameness which required veterinary attention. The cause of this lameness was not definitively determined, but these holes could have contributed the cause of this injury.

The holes shall be filled in, and the wire mesh shall be covered, to prevent injury and maintain these enclosures in good condition.

Correct by June 7, 2014

3.130

WATERING.

The water receptacles & the water in the two fox enclosures, and the outdoor bobcat enclosure have large accumulations of algae. The water appeared stagnant and slimy on the surface.

All water receptacles shall be kept clean and sanitary.

Correct by June 5, 2014

3.131(a)

SANITATION.

The indoor kinkajou, bobcat, & skunk rooms are dirty and have a high concentration of ammonia. The ammonia was in sufficient concentrations to cause an irritation of this inspector's nasal passages and difficulty in breathing. Additionally, the kinkajou was observed to have slight, clear, nasal discharges from both nostrils and was observed intermittently licking his nose to remove these discharges.

Inspection Report

The skunk room (bathroom) had large accumulations of old feces and food pellets on the floor &/or in the bathtub. This room also had a bottle of cleaner on the floor. The skunks are allowed free access in this bathroom.

High concentrations of ammonia are irritating to nasal, ocular, & respiratory passages. This can cause distress, difficulty in breathing, and does not minimize respiratory illnesses.

All animal enclosures shall be maintained in a clean fashion to minimize disease hazards and to reduce odors.

Correct by June 5, 2014

The exit interview was conducted with the licensee.
