Type: FOCUSED INSPECTION
Date: 29-AUG-2024

3.55

Watering.

The primary enclosure for the domestic rabbits had a water receptacle that contained a small amount of water and had an excessive amount of shavings and debris. This poses a risk of contamination to the enclosed rabbits. Water receptacles for rabbits must be cleaned and sanitized when dirty to keep them free from contamination.

Correct from 8-29-2024 onward.

3.129(a)

Feeding.

The enclosure housing an alpaca, deer, cavy, and goat contained no grain or hay. When hay was offered, the alpaca and the deer immediately started eating and continued eating steadily for more than ten minutes. This is an indication these animals are not being fed as often as necessary to satisfy their natural drive to forage throughout the day which is important for proper rumen function. Animals must be fed sufficient amounts and at an appropriate frequency to maintain good health.

Correct from 8-29-2024 onward.

3.156

Repeat

Watering

The cages housing the African gray parrot, cockatoo, and macaws had dirty water receptacles that contained excessive amounts of feed and debris. This poses a risk of contamination to the enclosed birds. Water receptacles for birds must be cleaned and sanitized as often as necessary to keep them free from contamination.

3.158(a)(1)

Cleaning, sanitization, housekeeping, and pest control.

The enclosure housing the cockatoo had a thick layer of spilled feed, waste, bedding material, and debris covering the tray underneath the wire cage floor. A large number of flies were buzzing around inside this lower portion of the cage. Accumulated waste is a potential source of contamination to the enclosed animal and increases the risk of disease,

Inspection Report

insects, and pests. Excreta and food waste must be removed from within and under the primary enclosure as often as necessary to prevent excessive accumulation.

Correct by 8-29-2024 onward.

3.158(d)

Cleaning, sanitization, housekeeping, and pest control.

There appears to be a lack of adequate pest control procedures at the facility. Large numbers of flies were observed around the cockatoo enclosure. In the food storage area, there was a trash can full of waste with no lid. There were numerous flies on and around this trash can. There were multiple trash cans located throughout the facility without lids. Open trash cans are an attractant to flies and pests, and improper storage of waste can result in pest infestation and disease hazards. The licensee must create and maintain an effective program for the control of pests so as to promote the health and well being of the animals.

To be corrected by 09-07-2024.

This inspection and exit interview were conducted with a facility representative.
