Type: ROUTINE INSPECTION

Date: 07-JUN-2016

### 2.40(b)(2)

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

The written program of veterinary care does not list drug names/dosages used for capture . There was a supply succinylcholine in the refrigerator and the ranch manager indicated that was one of the drugs used for capture prior to transporting exotic hoofstock. Paralytic drugs such as succinylcholine must not be used for capture. They have narrow safety margins and a slight overdose can cause the animal to suffocate while conscious resulting in pain and suffering.

The attending veterinarian must be consulted concerning drugs used for capture. The drugs with dosages must be listed on the program of veterinary care and the recommendations must be followed to ensure humane and safe capture for the animals.

CORRECT BY : 7-8-16

One red ruffed lemur was observed to have a red raised swelling on the right side of her face. The attending veterinarian was contacted a few weeks ago when care takers noted a swelling on her face and advised them to watch for abscess formation. The animal needs a vet exam and appropriate treatment must be provided.

The attending veterinarian is scheduled to come later in the day .

CORRECTED : Lemur received vet exam.

### 3.83

#### WATERING.

The water for the lemurs, gibbons and capuchins housed in the front primate enclosures is dark green and containers do not appear to have been cleaned in many days . The water for one pair of gibbons is cream colored

## Inspection Report

---

and flies are floating in the water. The water container for the capuchin pair has a black substance on the side of the container. Potable water must be provided to every non human primate housed at the facility to ensure their health and well being . Water receptacles must be kept clean and sanitized with a method described in section 3.84 ( b ) ( 3 ) ( ie. washing with appropriate detergent solution or hot water /detergent ) at least once every 2 weeks or as often as necessary to keep them clean and free from contamination.

CORRECT IMMEDIATELY

### 3.130

#### **WATERING.**

The water provided to the fennec fox is dark green . The water trough for the giraffe contains a large amount of algae growing in long strands from the sides of the trough. The algae extends from the sides of the trough to the top of the water. Water bugs can be seen in the water. Animals need large amounts of fresh water in hot weather and they may consume less if the water is contaminated. Potable water must be provided and water containers kept clean to ensure the health and comfort of the animals .

CORRECT BY : 6-8-16

The inspection and exit briefing was conducted by Dr. Pannill - USDA with the ranch manager. The licensee was also contacted by phone for an exit briefing.
