Type: RE-LICENSE INSPECTION

Date: 09-JUL-2024

2.40(b)(2)

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

The program of veterinary care states that all birds that have no history of vaccine status, be vaccinated for West Nile Virus. No vaccine records are available for review for "Mozart", an adult umbrella cockatoo and the facility representative states the animal has not been vaccinated for West Nile Virus. Failure to follow the program of veterinary care set by the attending veterinarian may result in illness or injury to animals. Exhibitors shall maintain programs of adequate veterinary care that include the appropriate methods to prevent, control and treat diseases and injuries.

2.40(b)(3)

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

Multiple adult fallow deer were observed to have single round raised skin masses on their necks. One deer had a mass located low on the neck that had hair loss on the surface and the skin appeared red. The animals were active and otherwise apparently healthy. The facility representative stated that the attending veterinarian had diagnosed previous lesions similar in appearance in the herd and indicated the masses were removed when located close to the eyes. The facility representative conveyed that the masses are monitored but cannot recall the last time they updated the attending veterinarian on the masses.

Failure to provide direct and frequent information on animal health to the attending veterinarian may result in prolongation of disease or spread of infectious disease. Each exhibitor shall observe all animals daily and provide direct and frequent communication on the problems of animal health and well-being to the attending veterinarian.

2.75(b)(1)

Records: Dealers and exhibitors.

Acquisition records for 3 domestic pigs and the disposition record for 1 wallaby were not available for review at time of inspection. Appropriate documentation of regulated animals is essential for proper identification, tracking of animals and for APHIS Officials to be able to carry out their duties. Exhibitors shall make and maintain complete records regarding the details of the acquisition and disposition of animals in their possession in order to account for all animal transfers and the sources of the animals.

Inspection Report

3.75(c)(1)(i)

Housing facilities, general.

The raised caged ledge attached to the side of the primary enclosure for "Cleo" the adult common marmoset has heavy rusting and flaking of the metal frame. Rusty surfaces cannot be effectively cleaned and sanitized. Any surfaces that come into contact with nonhuman primates must be free of excessive rust that prevents the required cleaning and sanitization, or that affects the structural strength of the surface.

3.150(c)(2)

Facilities, general.

Multiple areas of the wooden frame around the door of the primary enclosure for an adult umbrella cockatoo, "Mozart", are heavily chewed, worn or missing and exposing a metal screw. Excessive wearing of the housing material can compromise structural strength, present roughened and jagged surfaces where it is possible for the birds to injure themselves, and prevent proper cleaning and sanitization of a surface. Interior surfaces that come into contact with birds must be free of rust or damage that affects the structural integrity of the surface or prevents cleaning.

3.153(a)(1)(i)

Primary enclosures.

There are multiple sharp points and edges present in the primary enclosure for "Mozart", an adult umbrella cockatoo. Multiple metal wires are hanging from the sides of the primary enclosure and pointing inward. A metal screw approximately 1 inch in length is exposed by the door due to part of the wooden frame is missing. Sheet metal is used as paneling for many wall surfaces inside the primary enclosure and some edges are exposed, bent inward and appear jagged. Sharp points and edges may cause injury to the animal. The primary enclosure must be kept in good repair and have no sharp points or edges that could injure the bird.

3.154(c)(2)

Environment enhancement to promote psychological well-being.

A singly housed adult umbrella cockatoo, "Mozart", has a large patch of missing feathers on the abdomen that the facility representative indicates hasn't had any regrowth. In the avian environment enhancement plan, there is no documentation of special attention given to the animal based on its appearance and sign of being in psychological distress. The plan does address additional enrichment for this individually housed social species of bird. Failure to fully develop and document a plan for special consideration birds in all applicable categories may result in inadequate or intermittent care in promoting and addressing their psychological well-being. Certain birds must be provided special attention regarding enhancement of their environment in accordance with the instructions of the attending veterinarian, which includes birds that show signs of being in psychological distress through behavior or appearance.

This is a 1st Re-License Inspection for a Class "C" license. The inspection and exit briefing were conducted with the applicant.

All items must be in compliance within 2 more inspections or by September 7th, 2024 or the applicant will forfeit the
