Type: ROUTINE INSPECTION
Date: 14-MAY-2024

3.133 Critical

Separation.

On March 26, 2024, the facility started introducing the young male capybara, "Bagel", to the herd in the established capybara enclosure after several weeks of howdie cage interaction. During this introduction the facility reports that there were several aggressive interactions with the established male, "Chai", that resulted in "Bagel" limping on the right leg. The following day, March 27, 2024, the facility attempted introduction again, and during this period "Chai" continued to be aggressive toward "Bagel." At one point the facility representatives monitoring this introduction became distracted, then heard a loud sound, and when they looked, they noticed that "Bagel" was down in the hind legs. The attending veterinarian examined "Bagel" right away and determined that both femurs (hind legs) were fractured. After discussion with the AV, "Bagel" was humanely euthanized.

Animals housed in the in the same primary enclosure must be compatible. Failure to ensure compatibility can result in injury or death.

Corrected at the time of inspection May 14, 2024

This inspection and exit interview were conducted with facility representatives.
