Type: ROUTINE INSPECTION  
Date: 09-DEC-2024

---

### 3.75(b)

#### Housing facilities, general.

There was an excessive accumulation of cobwebs between enclosures for the adult cotton top tamarin and adult common marmoset and the adjacent wall. The wall also had some small spots of dark debris stuck to it. There is not a regular cleaning schedule for the walls and areas adjacent to the enclosures. Failure to clean areas surrounding enclosures housing nonhuman primates as often as necessary can lead to exposure to disease agents and become a haven for pests. Animal areas inside of housing facilities must be kept neat and free of clutter.

Correct by 14 December 2024.

### 3.75(e)

#### Housing facilities, general.

During inspection, food stored in containers with tight fitting lids were taken out of the refrigerator and placed on a kitchen counter directly adjacent to an open package of cigarettes, a lighter, and an ashtray filled with ash and used cigarettes. The licensee was prepping fresh produce on the opposite counter in the kitchen. The inspector smelled a moderate odor of environmental tobacco smoke in the kitchen. Storing substances that are toxic to nonhuman primates in food storage and preparation areas may contaminate food fed to the animals and subsequently cause illness or injury. Supplies of food must be stored in a manner that protects the supplies from spoilage, contamination, and vermin infestation.

Correct from this date forward of 12 December 2024.

### 3.84(a)

#### Cleaning, sanitization, housekeeping, and pest control.

The enclosure for Loni, an adult cotton top tamarin, had excreta accumulating on the bottom interior surface. The licensee stated that excreta is removed weekly from this enclosure. Failure to remove excreta daily from enclosures of nonhuman primates may result in poor psychological welfare and exposure to disease causing agents. Excreta and food waste must be removed from inside each indoor primary enclosure daily and from underneath them as often as necessary to prevent an excessive accumulation of feces and food waste, to prevent nonhuman primates from becoming soiled, and to reduce disease hazards, insects, pests, and odors.
