3.27(b)

Facilities, outdoor.

The facility has obtained a variance for housing guinea pigs outdoors. The variance requires proactive and effective cooling measures to prevent the animals from experiencing temperatures that exceed 85 degrees. The variance also states that if outdoor cooling measures are ineffective, the animals must be moved indoors.

Although facility representatives report that one aged guinea pig was periodically housed indoors in times of adverse outdoor conditions, the facility has not been moving the six guinea pigs indoors during times of elevated temperatures. A thermometer is present in the outdoor housing area, and temperature logs are maintained. Although ice trays are often offered, and fans may be utilized, there were numerous days when temperatures within the enclosure were recorded at over 85 degrees (up to 93.4 F).

High and low temperature extremes, or certain combinations of temperature, humidity, and time may cause distress and/or be detrimental to the guinea pigs' health and well-being. When outdoor heating, cooling or other protective measures are ineffective, the animals must be moved to an indoor area. Even if temperatures do not reach 85 degrees, animals must be proactively protected from environmental conditions that may be harmful to them. As per §3.26(a), the

Inspection Report

ambient temperature of indoor housing facilities must not fall below 60 degrees nor exceed 85 degrees.

Correct from this point forward.

3.75(c)(1)(i)

Housing facilities, general.

There were areas of a dark, reddish-brown, coated rust on the metal support structures for the platforms in the night quarters of the Lemur enclosures.

The bottom part of a metal door frame in the Siamang night quarters contained irregularly rough and coated surface areas of dark, reddish-brown rust. Additionally, in the night quarters there were several areas of discolored, dark reddish rust along a top metal surface and on the adjacent metal mesh fencing used to enclose the top of the enclosure.

Surfaces with excessive rust cannot be appropriately cleaned and sanitized and may trap bacteria or other organisms harmful to the animals. All surfaces in contact with non-human primates must be maintained on a regular basis and must be free of excessive rust that prevents the required cleaning and sanitization, or that affects the structural strength of the surface. A system of maintaining surfaces free of excessive rust must be in place to ensure the health and well-being of the animals.

Correct by 02/25/2023.

3.77(d)

Sheltered housing facilities.

Inspection Report

The outdoor island area of the Siamang enclosure did not provide adequate shade for the two Siamangs. Although the top of the outdoor climbing apparatus contains a shade structure, it did not function to protect the animals from the sun at time of inspection. Also, the facility representative stated the animals did not have access to their sheltered night quarters at time of inspection. Failure to provide adequate shade for all animals may lead to stress or discomfort from overheating. Sheltered housing facilities for nonhuman primates must provide adequate shelter from the elements at all times. They must provide protection from the sun, rain, snow, wind, and cold, and from any weather conditions that may occur.

Correct by 02/17/2023.

This inspection and exit interview were conducted with facility representatives.
