BECKY & LEONARD GOODMAN

Type: ROUTINE INSPECTION

Date: 04-SEP-2025

2.40(b)(2) **Direct** **Repeat**

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

- A 6 month old male dachshund named "Cookie" (ID# 10-25-08) was found in lateral recumbency, non-responsive and displaying an agonal breathing pattern. His mucous membranes were dry and very pale. Due to the severity of his condition the inspection was temporarily halted so the licensee could immediately take Cookie to the attending veterinarian for emergency treatment. The licensee reached the veterinary clinic but the dog died before treatment could be initiated. The licensee stated that the veterinarian said the cause of death was likely "parasites" or "something he ate". The licensee did not have any medical records for this animal, so it is impossible to determine if he was given appropriate preventive care beforehand.

Failure to identify and properly address medical concerns can have a severe negative impact on the health and welfare of an animal. The facility failed to provide and document proper preventive care, and failed to note this dog's clinical condition leading up to his death.

3.9(a)

Feeding

- An open box of dog biscuits was on the ground in the central kennel area. The box had numerous roaches on and inside, contaminating the biscuits and making them unfit for the animals to eat. There was no indication that any of the biscuits were actually being fed to the dogs. Improper storage of food is an attractant to pests and is a source of contamination to the dogs. Open containers of food must be properly stored to ensure the safety and welfare of the animals.

Corrected at the time of inspection

3.10(a)

Direct

Watering

- At the time of inspection 13 out of 16 water bowls (affecting 34 dogs) were contaminated with varying numbers of dead roaches and insects. These bowls were the only source of water available to the dogs. Water filled with dead/dying insects cannot be considered safe to drink and is a source of contamination to the dogs. All dogs must have potable water continuously available unless restricted by the attending veterinarian. The licensee must ensure that clean potable water is available to the dogs at all times.

Inspection Report

3.11(d)

Repeat

Cleaning, sanitization, housekeeping, and pest control.

- The facility has a severe infestation of roaches throughout the facility. Although the facility is using a pest control agency for treatment, the current efforts at control are clearly not sufficient to address the problem. Pests such as insects and roaches are a potential source of contamination to the animals. An effective program for the control of insects and external parasites must be established and maintained so as to promote the health and well-being of the animals and reduce contamination by pests in animal areas.

3.13(b)

Veterinary care for dogs.

- There were no medical records being kept for "Cookie", the male dachshund who was discovered in severe distress. Without proper medical records, it is impossible to determine any past conditions or treatments. Licensees must keep copies of medical records for all dogs and make those records available for inspection as requested.
Correct from this date (4 September 2025) onward

This inspection and exit interview were conducted with licensee.
