Type: ROUTINE INSPECTION
Date: 16-NOV-2022

3.53(a)

Primary enclosures.

Three rabbits were housed on the ground in a wire fence primary outdoor enclosure, approximately 3 feet high. The top was also enclosed in wire except for an uncovered opening measuring approximately 12 inches wide and 30 inches long at the back right corner. Other animals, including predators, have direct access to the rabbits which may cause stress, injury, or transmission of diseases. Outdoor housing facilities for rabbits must protect the animals from injury, contain them and restrict the entrance of other animals.

CORRECT BY: 11/30/2022

3.56(b)(3)

Sanitation.

The primary outdoor wire enclosure housing three rabbits is located on the ground and the wire is being cleaned with only soap, water, and a rag as needed. The dirt floor of the enclosure is spot cleaned, and hay is provided. The wire sides and top of the enclosure are not being sanitized since the water does not reach 180 degrees Fahrenheit and a disinfectant is not being applied. When enclosures are not sanitized adequately, there is higher risk of large numbers of germs remaining on the surface which creates a health hazard for the rabbits. Primary enclosures for rabbits shall be sanitized by washing them with hot water (180 degrees F) and soap or detergent, or by washing all soiled surfaces with a detergent

solution followed by a safe and effective disinfectant, or by cleaning all soiled surfaces with live steam or flame.

MUST BE CORRECTED BY: NOVEMBER 30, 2022

3.78(d)

Outdoor housing facilities.

Two lemurs have access to an outdoor enclosure surrounded by a 6-foot perimeter fence that lacks an adequate distance from the enclosure at two corners. The perimeter fence is only 5 inches away at the back right corner and only 18 inches away at the back left corner from the outdoor primary enclosure. A perimeter fence that is at least 6 feet high and 3 feet from the enclosure is needed with sufficient wire spacing to prevent unauthorized humans and other animals from going through or under it. Not having an adequate perimeter fence is a safety risk because other animals and/or people may contact them, and there is not adequate secondary containment. The facility shall ensure the outdoor housing facilities for the lemurs are enclosed by an appropriate perimeter fence, or a variance, if appropriate, needs to be obtained and can be requested from the Administrator/Regional Office.

MUST BE CORRECTED BY: DECEMBER 31, 2022

3.125(a)

Facilities, general.

Two areas within the outdoor wire fence enclosure housing 4 goats need attention:

- The back right corner of the wire fence has sharp points pointing in toward the enclosure where the wire isn't securely attached to the corner post from the ground up to a height of approximately 2 feet.
- The metal roof that overhangs both the front and back of the wooden shelter by approximately 2 feet is bent down and flared outward, so the corners of the metal roof's sharp edges are at an approximate height of 2 feet from the ground at the rear and 3 feet from the ground at the front.

These sharp edges and points may lead to injury if the animals rub against them. The outdoor housing facilities shall be
