2.31(c)(7)

Repeat

Institutional Animal Care and Use Committee (IACUC).

On April 5th, 2024, the IACUC conducted a Post Approval Monitoring (PAM) survey of a baboon user laboratory. The PAM members reviewed all the activities under the IACUC approved protocol (#NPH022). Following the review, the PAM survey determined the following observations/deviations in the approved protocol:

-Vascular Endothelial Growth Factor Gene was delivered alone rather than with estradiol.

-Biopsy of the vastus lateralis skeletal muscle was only obtained in the baboon offspring at 4 years of age. The protocol stated that a biopsy of the vastus lateralis skeletal muscle should be completed on the baboon offspring at 1 year, 2 year and 4 years old.

-Cationic Microbubbles and Definity contrast agents were administered at a higher dose than what was written in the approved protocol.

-Carprofen was administered subcutaneously (SC) for surgical procedures rather than intramuscular (IM) as described in the approved protocol.

-Buprenorphine was administered pre-emptively and post-operatively for survival surgeries. The approved protocol indicates that buprenorphine should only be administered post-operatively.

With respect to activities involving animals, the IACUC, as an agent of the research facility, shall review and approve, require modifications (to secure approval), or withhold approval of proposed significant changes regarding the care and use of animals in ongoing activities.

Corrected before the time of inspection through corrective action plan.
