TOTALLY TEENY TRAVELING
FARM L L C

Type: ROUTINE INSPECTION

Date: 10-MAY-2022

3.56(b)(3)

Sanitation.

Two rabbit enclosures are not being sanitized correctly and one has some rust developing on the metal bars of the enclosure. The enclosures are cleaned weekly with a bleach spray followed with a detergent and water solution. One enclosure has areas of wire caging with no coating and is beginning to rust. Small quantities of rust were able to be removed by the inspector touching the wires. Proper sanitization of enclosures is necessary to prevent disease hazards to the animals housed within. Rust can impede the sanitation process by creating an irregular surface in the metal that prevent the disinfectant from contacting all surface areas. Correct by 15 May 2022 by disinfecting the rabbit enclosures at least once every 30 days in accordance with 3.56(b)(3) such as using a detergent and soap, followed by a disinfectant, and by eliminating areas of rusted wire.

This inspection and exit interview were conducted with the licensee.
