Certificate: **65-C-0582**

Site: 001

Blue Springs Safari LLC.

Type: ROUTINE INSPECTION

Date: 06-MAY-2025

2.40(b)(3)

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

Two mountain coati were observed excessively itching with patchy hair loss. Upon closer inspection, black insects were observed within the hair coat. The presence of insects were pointed out to the licensee and he informed us that the animals are due to receive treatment/prevention for external parasites next week. The condition had not been identified by the facility prior to the inspection and as a result, the condition of these animals were not communicated to the Attending Veterinarian and they did not receive veterinary care. Daily observations of animals to identify medical problems is essential to identify conditions quickly and initiate treatment within a timely manor. Correct by observing all animals at least daily to identify physical, medical, or behavioral problems. Additionally, ensure that all findings are communicated in a timely manner to the Attending Veterinarian so that they can examine animals and ensure that appropriate treatment is provided as required by section 2.40(b)(3). Correct by 5/13/2025.

3.131(c)

Sanitation.

There was a large accumulation of old farm equipment, new and old fencing material, scrap metal and additional miscellaneous items in the pasture that contained 22 fallow deer. These materials can cause injury to the animals if they become trapped in the equipment or run into sharp edges. Premises shall be kept clean and in good repair to protect the animals from injury and to facilitate the prescribed husbandry practices set forth in this subpart. Accumulations of trash and equipment shall be placed in designated areas outside of animal enclosures and cleared as necessary to protect the health of the animals. Correct by 5/20/2025.

3.158(d)

Cleaning, sanitization, housekeeping, and pest control.

Multiple areas in and around the enclosures that house birds need a more robust pest control program.

- In and around the enclosures that housed 125 chickens contained an abundance of flies.
- In the walk-through aviary, the smell of rodent urine was noted and approximately 50% of the dirt floor contained burrowing holes that indicated the potential for rodent activity. Upon closer inspection, 3 dead decomposed rodents were located in cobweb covered live traps.

Pests such as flies and rodents can affect the health and well-being of animals by spreading disease and contaminating food, surfaces, and animal housing areas. Correct by 5/20/2025 by establishing and maintaining an effective program to
