Type: ROUTINE INSPECTION
Date: 09-APR-2024

2.40(b)(2)

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

One male goat named Valcour was observed resting by himself in the sheltered structure on both of his front leg knees rather than standing on his feet. When encouraged to stand he was at first stiff and showed a limp on the front legs. His hooves appear thickened and irregular but were difficult to visualize due to mud present. After moving around for a few minutes he did appear more comfortable but still favored his front limbs. The licensee stated that he has a history of chronic hoof issues and is overdue for a hoof trim which the vet typically does. Regular foot trims and evaluation/treatment of atypical hooves is necessary to avoid pain and discomfort to the goat. The facility shall ensure that appropriate methods to prevent, control and diagnose the hoof issues of this goat are available and provided. Correct by 4/13/24.

3.150(g)

Facilities, general.

Two of the three rhea enclosures are wet and muddy. The three enclosures are located on a slight slant of the ground. The lowest enclosure (closest to the house) is completely wet and muddy with no dry area. A bit of straw is present in the sheltered area but the ground underneath is muddy even there. The three rhea's legs in this enclosure are wet and muddy. The middle enclosure is also wet and has standing water present along the fence between the two enclosures. These birds also have some mud on their legs. Their sheltered area is also wet. The birds require a dry area to stay comfortable and maintain body temperature. Housing facilities for birds must have drainage systems that are constructed and maintained so that water is rapidly eliminated and animals have the option to remain dry. Correct by 4/19/24.

This inspection and exit interview were conducted with the licensee.
