

Inspection Report

City Of Clovis
500 Sycamore Street
Clovis, NM 88101

Customer ID: **3489**
Certificate: **85-C-0006**
Site: 001
CITY OF CLOVIS

Type: ROUTINE INSPECTION
Date: 31-JAN-2024

3.127(d) Repeat

Facilities, outdoor.

A double-sided gate that is part of the perimeter fence near the haybarn has barbed wire strands along the top of the right side that are damaged and hanging downward on the outside, resulting in the gate being ~88" in height, short of the 96" (eight feet) required for the species at the facility. Several sections of the perimeter fence on the side bordering Sycamore Street have barbed wire strands at the top that are bent, broken or disrupted by trees, resulting in damage and causing the fence to be shorter than the required eight feet in height.

Perimeter fences that are in poor repair or which are unstable, cannot serve as effective secondary containment for the animals at the zoo and can be an entry point for unauthorized persons or predators that could cause harm to the animals. The licensee must ensure that all perimeter fences at the facility are of adequate height and in good repair to maintain their strength and integrity. The perimeter fence must be a minimum of three feet away from any primary enclosures and constructed so that it protects the animals by restricting entry of outside animals and preventing unauthorized persons from going through it, or under it, or having contact with the animals in the facility.

3.131(a)

Sanitation.

An indoor room housing two adult wallabies during colder weather has platform areas that are uniformly covered in dried animal waste that has settled into the textured surfaces.

Such accumulations encourage microbial growth, contamination of food and soiling of the animals, which can lead to animal discomfort or illness. The facility must ensure that excreta is removed from primary enclosures as often as necessary to prevent contamination of the animals therein and to minimize disease hazards and reduce odors.
TO BE CORRECTED BY 2/6/2024

3.131(c) Repeat

Sanitation.

In the commissary, one of the walk-in refrigerated units used to prepare and store food for various animals at the zoo, has dried, brownish material accumulated on the interior shelves and surfaces.

Accumulations of food waste encourage microbial growth and contamination of food, which can be a source of disease-causing agents and odors. The facility must ensure that premises (buildings and grounds) are kept clean and in good repair in order to protect the animals from injury and to facilitate husbandry practices.

Inspection Report

3.158(a)(1)

Repeat

Cleaning, sanitization, housekeeping, and pest control.

The indoor portion of an enclosure containing four individually-caged adult birds of undetermined sex (a blue and gold macaw, a scarlet macaw a Jandaya parakeet and a military macaw) has an accumulation of excreta on the floors and sides of the primary enclosures as well as on the walls of the room.

Failure to clean accumulations of excreta and food waste can increase disease hazards, insects, pests, and odors. The licensee must ensure that excreta and food waste are removed from primary enclosures and from under and around primary enclosures as often as necessary to prevent excessive accumulation of feces and food waste, to prevent soiling of the birds contained in the primary enclosures, and to reduce disease hazards, insects, pests, and odors.

This inspection and exit interview were conducted with a facility representative.
