WILDLIFE WORLD ZOO INC.

Type: ROUTINE INSPECTION

Date: 23-JAN-2024

3.150(a)

Facilities, general.

Multiple enclosures and shelters for birds are in disrepair. These areas include:

- Rust present on the metal door frame for the African penguin indoor enclosure. Some of the rust is actively flaking off and creating sharp edges to which birds have access.
- Multiple wooden shelter boxes that are chewed around the openings or on the top of the boxes, exposing nails and screws which are a hazard.
- The window frame around the toucans' nestbox has paint peeled by the birds and a nail protruding towards the window ledge.
- The shelter for two Umbrella cockatoos housed outdoors on an island has a large section of the shelter wall chewed with nails exposed down from the metal cover.
- Metal wire sharp point remnants from enrichment fixtures in the outdoor primary enclosures of the Rock Pebbler parakeets and two Green-winged Macaws. (Corrected at time of inspection for these two enclosures).

Failure to maintain housing facilities in good repair may negatively affect the welfare of the birds within. Housing facilities for birds must be kept in good repair to protect the birds from injury.

Correct by 16 February 2024.

2.40(b)(3)

Critical

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

The desiccated carcasses of 2 finches were observed by inspectors in the finch flight enclosure. The extent of decay of the bodies indicates the birds passed away many days prior. The facility representatives acknowledged they had not known about the dead birds. The enclosure design is 3 rectangular vertical silos with 12 elevated nestboxes, all connected by 2 overhead flight tunnels that are approximately 30 feet in length each. The primary material of the enclosure is wire mesh. This enclosure houses approximately 36 zebra finches. Also observed in this enclosure were 2 nests made by birds outside of the nestboxes provided. One nest with eggs was situated on the platform designed to hold a water dish and the other was built on the ground in a corner with no shelter and had 3 fledglings present. An inspector observed that at least one of the fledglings had feather loss at the base of the neck and relayed this information to facility representatives who alerted the attending veterinarian promptly. During daily observations, the facility missed dead birds

Inspection Report

in the enclosure, abnormal behavior for the species (nesting on ground) and feather loss in fledglings. Failure to conduct adequate daily observations to identify changes in normal behavior, signs of overcrowding or dead animals can result in unnecessary loss of life or detrimental impact to health and psychological welfare of animals. Each exhibitor shall establish and maintain programs of adequate veterinary care that include daily observation of all animals to assess their health and well-being. Problems of animal health, behavior and well-being shall be conveyed to the attending veterinarian in a timely manner.

Correct from this date forward of 08 February 2024.

3.75(c)(1)(ii)

Housing facilities, general.

Sharp metal edges are present on ring-tailed lemur islands (corrugated metal roofing for shelters have jagged edges) and black and white ruffed lemur enclosure (cut metal wire paneling used as struts for feeding platform has sharp points). Multiple ring-tailed lemurs were observed sitting on top of the metal roofed shelters. Surfaces in nonhuman primate enclosures that have sharp or jagged edges may cause bodily harm to the animals. Any surfaces that come in contact with nonhuman primates must be free of jagged edges or sharp points that might injure the animals.

Correct by 01 March 2024.

3.75(e)

Housing facilities, general.

Rusty tin cans are being used for portioning out monkey biscuits and poison rat bait is being stored amongst dry food in dry food storage area. Using rusted containers for storing food and storing toxic substances in food storage areas can cause illness and harm to animals. Supplies of food must be stored in a manner that protects supplies from spoilage and contamination. Substances that are toxic to nonhuman primates must not be stored in food storage and preparation areas but may be stored in cabinets in the animal areas. Corrected at time of inspection.

Correct from this date forward of 08 February 2024.

3.101(f)

Facilities, general.

The washroom facility within the sea lion building for employee use is being primarily used as an office and storage room. There is a large wooden bird crate, paintings, miscellaneous buckets, and various clutter in the toilet area. The shower area contains desk chairs and computer equipment in use for data entry. The employees maintained that they did use the area for showering after cleaning sea lion pools and fish break out. The presence of the equipment and clutter in this area do not facilitate the required cleaning and sanitization daily that is required.

The additional employee shower on facility grounds was located approximately 300 yards from the sea lion habitat. Failure to provide conveniently located washroom facilities for employees can aid in spread of disease among those working with marine mammals and handling their diets. Washroom facilities containing basins, sinks and as appropriate, showers, must be provided and conveniently located to maintain cleanliness among employees, attendants, and

Inspection Report

volunteers. These facilities must be cleaned and sanitized daily.

Correct by 01 March 2024.

3.125(a)

Facilities, general.

Multiple outdoor primary enclosures have structures or fencing that is in disrepair and needs to be addressed. These include:

- Chain link fencing in some hoofstock areas (oryx & kudu) wrapped around trees is no longer secured to the tree and is now protruding away from the tree and into the enclosure.
- Chain link fence at the base around the nilgai yard is curling into the primary enclosure creating large gaps where the fence meets the ground.
- The top mesh and metal support tubing for the educational otters is significantly damaged at the roofline due to treefall. This damage impacts the structural integrity of this enclosure.
- Peeling paint is present on an automatic gate (B gate) in the safari yards (accessible to guests via tram) and is within reach of animals.

Failure to maintain outdoor housing facilities in good repair and ensure structural integrity can result in injury or escape of animals. Facilities housing animals must be maintained in good repair to keep the enclosures structurally sound and for the safety of the animals.

Correct by 12 April 2024.

3.128

Space requirements.

The primary enclosure for the education Linne's two-toed sloth does not provide enough horizontal space and perching to allow for normal postural movements and adequate freedom of movement. This is an enclosed space to maintain heat and humidity and is an approximately 4x4x6ft metal enclosure. There is one rest/sleeping crate present for the sloth. There is no vertical branch that extends the length of the enclosure to allow the sloth to easily come down for defecating and urinating. The horizontal branches do not span the full width of the enclosure to allow for a full arm stretch, thus limiting postural adjustment. Sloths are a nocturnal species and will cover great distances at night in the wild, foraging for food. The size of this enclosure does not permit adequate freedom of movement including a full horizontal stretch normal for the species. Inadequate space for normal postural adjustments for the species can result in poor body condition and psychological welfare of the animal. Enclosures shall be constructed and maintained so as to provide sufficient space to allow each animal to make normal postural and social adjustments with adequate freedom of movement.

Correct by 16 February 2024.

3.131(c)

Sanitation.

Inspection Report

Housekeeping in several areas of the facility are not kept clean. These include:

- The shelter area for the outdoor housed kangaroos has a bottle of bleach on a bucket of chemicals directly on the ground next to a mineral block. (Corrected at the time of inspection).
- An empty enclosure between the two clouded leopards' enclosures is being used for storage of miscellaneous items such as chemicals and cleaning supplies such as WD40, next to open bags of food. Some of the chemicals and miscellaneous items are within reach of the female leopard. (Corrected at time of inspection).
- The primary hay storage is in a single covered three-sided barn directly adjacent to miscellaneous transport crates, wooden barrels and supplies that have accumulated dust. The hay must be kept away from other non-food items to facilitate the prescribed husbandry practices.

Storage of cleaning chemicals and miscellaneous items directly next to feedstuff and oral supplements may cause illness or injury to animals. Premises shall be kept clean and in good repair to protect the health of the animals and to facilitate prescribed husbandry practices set forth in Subpart F of the Animal Welfare Act.

Correct by 01 March 2024.

3.153(a)(2)

Primary enclosures.

Multiple avian enclosures lack appropriate perching in size and number. This includes:

- The three vertical finch enclosures with flight cages house approximately 36 finches and many of the finches are perching on the wire walls or resting on the ground due to lack of available perches.
- Peafowl that have no perching provided for a species that usually roost high in the evenings.
- Very large diameter logs for perching for cockatoos which cause the birds to hold their feet in an abnormal conformation.

Failure to provide species appropriate perches may result in injury to the birds such as development of foot sores and can contribute to their discomfort. Furniture-type objects such as perches must be species appropriate and designed and maintained so that they prevent harm to the bird.

Correct by 16 February 2024.

3.154(b)

Environment enhancement to promote psychological well-being.

The physical environment for multiple bird species including cockatoos and macaws had either no or very limited enrichment through materials or activities. There was no additional cage complexity provided, nor objects to manipulate or any use of foraging or task-oriented feeding methods. A few of the birds showed signs of feather plucking, one pheasant was moving along the primary enclosure in a repetitive abnormal behavior pattern and a few of the parrots were abnormally quiet and showed little to no interest in guests or their caretakers. The macaw in the diversity building is chewing at the concrete walls when he is placed in holding at night. These behavioral signs indicate that enriching the physical environment is necessary to provide the birds with means to express non-injurious species typical activities. The physical environment in primary enclosures must be enriched by materials or activities at an appropriate frequency to promote needs the psychological welfare of the birds.

Date:

10-MAY-2024

Inspection Report

Correct by 16 February 2024.

3.154(c)

Environment enhancement to promote psychological well-being.

The facility houses multiple social species of birds in enclosures as solitary birds and has not addressed the individual animals in the environment enhancement plan. A few of these social birds housed alone, do not have the ability to see or hear another bird, like the Blue-and-gold macaw housed in the Diversity of Life building. This bird is on display as a single bird and housed in a back holding area alone. He is non-reactive and non-vocal to the caretakers and guests in the area which is abnormal for the species. A few of these solo housed birds are showing abnormal behavior patterns such as a pheasant that moves along the primary enclosure in a repetitive abnormal behavior pattern for an extended period. Failure to provide additional enrichment to special consideration birds such as those showing signs of stress or singly housed can cause further detriment to their physical and psychological conditions. These birds require special considerations in their environmental enhancement plan based on their individual needs in order to promote their psychological welfare.

Correct by 16 February 2024.

3.158(a)(1)

Cleaning, sanitization, housekeeping, and pest control.

The night holding enclosure for the indoor housed adult Blue-and-gold Macaw located in the Diversity of Life building has generally grimy surfaces, excessive food litter and droppings present. The enclosure is snugly fit in an alcove under a staircase and is dimly lit. Adjacent to the enclosure is a large bird cage that a facility representative stated had not been in use for approximately 8 months. A tray on top of this bird cage was littered with dust and rodent feces. A roach bait trap was placed on a wall adjacent to the night holding enclosure for the macaw. There was also a plastic bottle labeled "Febreze" grouped with cleaning supplies that the facility representative stated was used for odors in the area. Failure to adequately remove excreta and food waste from inside, around and under primary enclosures as often as necessary can result in introduction of insects, pests, odors and disease hazards for birds. Excreta and food waste must be removed from primary enclosures and from under and around primary enclosures as often as necessary to prevent excessive accumulation of feces and food waste, to prevent soiling of the birds contained in the primary enclosures, and to reduce disease hazards, insects, pests and odors. Corrected at time of inspection.

Correct from this date forward of 08 February 2024.

3.158(d)

Cleaning, sanitization, housekeeping, and pest control.

Numerous outdoor bird enclosures contained multiple small sparrow-type wild birds that were observed eating diets of the regulated birds and one dead sparrow was also found in an enclosure. Sparrow droppings were also observed on multiple surfaces in affected areas. A sampling of affected birds include one adult Lilac-Crowned Amazon and three adult Red-Fronted Macaws. Failure to effectively manage avian pests can introduce communicable diseases to birds under care of the facility and increase contamination of animal areas. A safe and effective program for the control of insects,

ectoparasites, and avian and mammalian pests must be established and maintained so as to promote the health and well-being of the birds and reduce contamination by pests in animal areas.

Correct by 01 March 2024.

This inspection and exit interview were conducted with facility representatives.
