Certificate: 23-C-0039

Site: 001

ANIMALAND ZOOLOGICAL PARK

Type: ROUTINE INSPECTION

Date: 15-OCT-2015

3.125(a) REPEAT

FACILITIES, GENERAL.

Section 3.125(a) Structural strength: The enclosure housing two white fallow deer has a 10 inch gap under the fence between the hay rack and the shelter. The deer may try to put their head under the fence to reach the grass on the other side and be injured. The male fallow deer with antlers may get his head caught under the fence. The gap under the fence must be eliminated to protect the deer from injury. This is a repeat non-compliance that was cited earlier this year.

3.127(c) REPEAT

FACILITIES, OUTDOOR.

Section 3.127(c) Drainage: The following areas have an accumulation of mud.

- 1) There is a large muddy area by the hanging hay rack in the enclosure housing 2 white fallow deer. Their hooves are coated with mud.
- 2) There is a large muddy area with puddles by the water receptacle in the enclosure housing 5 Sika deer.
- 3) There is a large muddy area in the left back corner by the hanging hay rack in the enclosure housing 14 fallow deer of various colors. Their hooves are coated in mud.
- 4) There is a large muddy area with water puddles by the water receptacle and in front of the shelter in the enclosure housing 2 bison.
- 5) There is a large muddy area by the hanging hay rack in the enclosure housing 3 Barbados sheep. Their hooves are wet and muddy.

These animals have to walk through mud to get to their hay or water. Walking through mud and water may cause problems such as foot rot. The mud and standing water may also attract insects which may transmit diseases and/or annoy the animals. The drainage must be improved to rapidly eliminate excess water to prevent muddy

Inspection Report

conditions to protect the health of the animals. This is a repeat non-compliance that was cited earlier this year.

3.127(d) REPEAT

FACILITIES, OUTDOOR.

Section 3.127(d) Perimeter fence: The following areas of perimeter fence must be repaired or maintained.

1) A fallen tree over the perimeter fence was removed, but the fencing is still only about 6.5 feet in height. The area of fencing is beyond the rolls of chain link fence near the perimeter fence. The perimeter fence must be restored to its original height of 8 feet for the dangerous animals housed at the facility.

2) The perimeter fence by the buffalo had the three loose wood fence posts straightened, but the fence is only 7-7.5 feet in height instead of 8 feet.

3) The perimeter fence by the pond has the frame posts for the barbed wire angled more horizontal than vertical resulting in the fence only being about 6.5 feet in height instead of 8 feet.

The facility must establish and maintain a program to keep the 8 foot perimeter fence in good repair to restrict animals and unauthorized persons from gaining access into the facility and to act as a secondary containment system for the animals housed within the facility. This is a repeat non-compliant item that remains uncorrected.

An exit briefing was conducted with the licensee.
