Type: FOCUSED INSPECTION
Date: 18-NOV-2025

2.40(b)(3)

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

At the time of inspection, a blue and gold macaw was observed to have a markedly enlarged cervicothoracic region. The breast area appeared significantly distended and abnormal. There is no evidence that the attending veterinarian had been notified or consulted regarding the animal's condition. Failure to identify and report this condition to the attending veterinarian prevents timely diagnosis and appropriate treatment, placing the macaw at risk for pain, distress, or worsening illness.

The facility must ensure that all animals are observed daily and that any signs of illness, injury, or abnormality are promptly communicated to the attending veterinarian. A licensed veterinarian must evaluate the macaw, determine the cause of the enlargement, and provide appropriate care. Documentation of the veterinary assessment and any prescribed treatment must be maintained and made available for review.

To be corrected by 12-1-2025 based on inspection findings of 11-18-2025.

2.131(d)(2)

Handling of animals.

During the inspection, it was observed that members of the public were allowed to have direct contact with and feed a lemur without a facility attendant present. The interaction took place at the animal's primary enclosure. There was no public barrier and no attendants present to monitor the encounter or ensure safe and appropriate handling practices. Allowing public feeding and contact with regulated animals without continuous supervision by a knowledgeable and trained attendant presents a significant risk to both the animal and the public. Unsuitable interactions can lead to stress or injury to the lemur and increase the risk of bites, scratches, or other adverse incidents involving the public.

The facility is responsible for ensuring that all public interactions with animals are continuously supervised by a trained attendant to safeguard animal welfare and public safety. Immediate corrective action is necessary to ensure that all future public-animal interactions occur only under proper supervision.

To be corrected by 11-19-2025 based on the inspection dated 11-18-2025.

3.125(a)

Facilities, general.

Inspection Report

During inspection, an exposed electrical outlet was observed inside the primary enclosure housing two kangaroos. The outlet lacked an appropriate cover or protective barrier. This created a potential electrical shock and fire hazard, as the animals could directly contact or manipulate the outlet.

The condition was not identified or corrected by the licensee prior to inspection, despite being clearly visible within the enclosure. Failure to maintain facilities in good repair and free of hazardous conditions places the animals at significant risk of injury.

The licensee must ensure that all electrical installations within or near animal enclosures are properly maintained, covered, and protected from animal access to prevent potential harm.

To be corrected by 12-1-2025 based on the inspection dated 11-18-2025.

3.131(c) Repeat

Sanitation.

Numerous cobwebs were observed on the ceiling above the enclosure for the silver fox. The cobwebs have collected dust and debris over time. Premises (buildings and grounds) shall be kept clean and in good repair in order to protect the animals from injury and to facilitate the prescribed husbandry practices set forth in this subpart.

3.153(a)

Primary enclosures.

The enclosure housing 27 Parakeets has a wooden roof panel that is separated from the front wall creating a large open space in the ceiling of the enclosure. The open space is large enough to allow parakeets to potentially escape the enclosure.

Primary enclosures must be designed and constructed of suitable materials so that they are structurally sound. The primary enclosures must be kept in good repair.

To be corrected by 12-1-2025 based on the inspection of 11-18-2025.

3.158(c)

Cleaning, sanitization, housekeeping, and pest control.

During the inspection, a paint container and various maintenance equipment were observed stored within the area housing guinea fowl. These materials were accessible to the animals and presented potential risks, including exposure to toxic substances, ingestion of foreign materials, and physical injury from tools or equipment. Housing areas must be maintained in a manner that protects animals from hazards and ensures their safety and well-being.

The presence of improperly stored paint and maintenance items in the primary animal area demonstrates a failure to provide safe and properly maintained facilities as required by the Animal Welfare Act. This condition could compromise the health and safety of the guinea fowl.

All paint, chemicals, tools, and maintenance equipment must be promptly removed from animal areas and stored in a secure, designated location inaccessible to the guinea fowl. The facility must ensure that animal housing areas remain free of hazardous materials at all times to protect the health and well-being of the animals.

Inspection Report

This is a continuation of the report for the routine inspection conducted 11-18-2025 and contains the remaining non-compliances found during the inspection. The exit briefing for the items included on this report was conducted on 11-18-2025.

This inspection was conducted with the facility representative on 11-18-2025. The exit interview was conducted with the facility representative on 11-18-2025.
