3.56(b)

Sanitation.

The rabbit's indoor primary enclosure, including their food and water receptacles, as well as their outdoor enrichment enclosure are not being sanitized with sufficient frequency. When asked, a facility representative stated that both the indoor and outdoor rabbit enclosures are cleaned up to twice weekly but are not sanitized at least once every 30 days. The rabbit's food and water receptacles are being cleaned with soap and water daily, but not sanitized at a minimum frequency of once every 2 weeks. When enclosures, and food and water receptacles, are not sanitized adequately, there is higher risk of large numbers of germs remaining on the surfaces which creates a health hazard for the rabbit. Primary enclosures for rabbits shall be sanitized by washing them with hot water (180 degrees F) and soap or detergent, or by washing all soiled surfaces with a detergent solution followed by a safe and effective disinfectant, or by cleaning all soiled surfaces with live steam or flame at least once every 30 days or sooner if dirty. Also, all food and water receptacles shall be kept clean when dirty and be sanitized at least once every 2 weeks.

MUST BE CORRECTED BY: AUGUST 5, 2022.

### Inspection Report

Upon arrival for inspection, two lemurs were not in their indoor enclosure, but the facility representative said they were in their outdoor enclosure as part of their enrichment at that time. When inspecting the outdoor enclosure, after the lemurs had returned to their indoor enclosure, there was not a complete perimeter fence surrounding it. Currently, only two sides have a sufficient perimeter fence created by two walls of the main building. Otherwise, there is no perimeter fence along the other two sides that face public walkways. A perimeter fence that is at least 6 feet high and 3 feet from the outdoor enclosure is needed on all four sides with sufficient wire spacing to prevent unauthorized humans and other animals the size of dogs, skunks, and raccoons from going through or under it. The perimeter fencing is necessary to keep unwanted species of animals and humans out as well as serve as a secondary containment. The facility shall ensure the outdoor enrichment housing facilities for the lemurs are enclosed by an appropriate perimeter fence, or a variance, if appropriate, needs to be obtained and can be requested from the Administrator/Regional Office.

MUST BE CORRECTED BY: DECEMBER 5, 2022

### 3.84(b)(3)

#### Cleaning, sanitization, housekeeping, and pest control.

The food and water receptacles for the lemurs and tamarins are hand washed with water and soap daily, but sanitization doesn't occur at the required two-week frequency. Not sanitizing their food and water receptacles properly creates risk for illness and/or disease. Food and water receptacles must be kept clean and must be sanitized at least once every 2 weeks using one of the following methods: 1) live steam under pressure, or 2) washing with hot water (at least 180 degrees Fahrenheit) and soap or detergent, or 3) washing all soiled surfaces with appropriate detergent/disinfectant product that accomplishes the same purpose, with a thorough cleaning of the surfaces to remove organic material first, and then to provide sanitization followed by a clean water rinse, or as often as necessary to provide for the health and well-being of the animals.
