Inspection Report

Lynnwood Park Zoo 1071 Wells Road Jacksonville, NC 28546 Customer ID: 1927

Certificate: 55-C-0001

Site: 001

Lynnwood Park Zoo

Type: RE-LICENSE INSPECTION

Date: 05-FEB-2025

3.125(a) Repeat

Facilities, general.

Several enclosures are not being maintained to protect the animals from injury. In one of the silver fox enclosures (housing three silver foxes), the underlying dig wire and side wire has been exposed along the front of the enclosure, creating an large hole under the wire. In the African Crested Porcupine enclosure, there are two layers of mesh under the enclosure floor to prevent animals from digging and escaping. Inside of one shelter, the top layer of mesh has a large hole, about 16" in diameter and the bottom layer of mesh is also exposed. This creates a gap between the two layers of mesh where an animal could enter. Having exposed mesh or gaps in enclosures can lead to animals becoming injured or entrapped. Correct by ensuring outdoor housing facilities are structurally sound and shall be maintained in good repair to protect the animals from injury and to contain the animals.

3.127(d)

Facilities, outdoor.

There are several areas along the facility's perimeter fence that are not 6 ft. tall. Parts of the fence have become loose from the top of their support posts, allowing the fence to be pushed/pulled down by a couple feet. In other sections the fence has collapsed over time, causing the height of the fence to drop several inches below 6 ft. Perimeter fences that are under 6 ft. in height are easier for unauthorized personnel to gain access to the facilities and animals within, putting their health and safety at risk. Correct by ensuring the facility's perimeter fence is at least 6 ft. in height and intact around the animal enclosures to keep animals and unauthorized persons out.

3.158(a)(1) Repeat

Cleaning, sanitization, housekeeping, and pest control.

Three bird enclosures that house primarily pigeons and a few exotic pheasants have surfaces that are not being cleaned frequently enough. All of the enclosures have accumulated amounts of excreta piled on top of the pigeon boxes and in some areas of the resting platforms where the birds tend to roost. Excessive excreta in primary enclosures can soil the birds, increase disease hazards, and attract pests into the enclosure. Correct by removing excreta and food waste from primary enclosures and from under and around primary enclosures as often as necessary to prevent excessive accumulation and soiling of the birds, and to reduce disease hazards, insects, pests, and odors.
