FORT COLLINS, CO 80523

Customer ID: 1195

Certificate: 84-R-0003

Site: 001

COLORADO STATE UNIVERSITY

Type: ROUTINE INSPECTION

Date: 15-FEB-2022

2.33(b)(3) Repeat

Attending veterinarian and adequate veterinary care.

In a free-flight bat room, inspectors saw a dead bat in the folds of one of the roosting tarps. This bat appeared to be desiccated and was readily visible without the inspector having to move the tarps.

Effective daily observations allow the facility to assess the health of the animals. Failure to observe medical problems, including animal deaths, can result in prolonged illness and pain of individual animals and undetected colony/herd health concerns. The facility must observe all animals daily and then ensure a mechanism of direct and frequent communication with the attending veterinarian so that timely and accurate information on problems of health, behavior, and well-being are conveyed and so that the medical conditions of the animals can be evaluated by the veterinarian.

3.131(a) Repeat

Sanitation.

-There is an accumulation of feces in the veterinary teaching horse enclosure that covers a majority of the pasture as well as the floor of the shelter structure.

-There is an accumulation of feces in the veterinary teaching sheep pen that covers a majority of the shelter floor and enclosure. There is also a large pile of feces and deteriorating hay that has been raked up for collection but remains within the enclosure.

Inspection Report

-There is an accumulation of feces in the veterinary teaching sheep barn pasture that covers a majority of the shelter

floors and enclosure.

-There is an accumulation of feces in both ARBL sheep pens that covers the entirety of the shelter area and more than

half of the enclosure. The caretaker for this area said that the pens had not been cleaned since November.

-There is an accumulation of fresh and deteriorating feces in the teaching mare pasture at the Equine Repro Lab that

covers the floor of the shelter, the feeding area, and the rest of the enclosure. There is also a large pile of feces and

deteriorating hay that has been raked up for collection but remains within the enclosure.

Accumulations of excreta are especially of concern when they occupy an animal's shelter structure or interfere with its

access to food and water sources. These areas also attract pests and can play a role in disease transmission. The

registrant must ensure that excreta be removed from primary enclosures as often as necessary to prevent contamination

of the animals contained therein and to minimize disease hazards and odors.

This inspection was conducted from 2/15/22 to 2/17/22 and the exit interview was conducted on 2/17/22 with facility

representatives.
