Type: ROUTINE INSPECTION

Date: 06-NOV-2024

### 2.75(b)(1)

#### Records: Dealers and exhibitors.

The inventory and records are missing the acquisition of a bat-eared fox that was recieved in July 2024. There is no documentation on when, where or from who the animal was received or any documentation of the animal being at the facility, or any disposition if the animal was given to someone else. The licensee advised they are the owner of the bat-eared fox and failed to put the animal on their inventory.

The lack of complete records of acquisition and disposition does not allow for proper management or tracability of the regulated animals.

Every dealer other than operators of auction sales and brokers to whom animals are consigned, and exhibitor shall make, keep, and maintain records or forms which fully and correctly disclose the following information concerning animals other than dogs and cats, purchased or otherwise acquired, owned, held, leased, or otherwise in his or her possession or under his or her control, or which is transported, sold, euthanized, or otherwise disposed of by that dealer or exhibitor. The records shall include any offspring born or hatched of any animal while in his or her possession or under his or her control, to the extent that any identification or counting of offspring can be carried out without unduly disturbing nesting or rearing activities.

To be corrected by: November 10, 2024

### 3.84(b)(2)

## Cleaning, sanitization, housekeeping, and pest control.

There are two primary enclosures that contain a marmoset and tamarin that have a moderate buildup of food, greasy brown grime and other debris on all of the bars inside the enclosure. The primary enclosures are not being sanitized often enough to prevent the buildup of old food and debris that the regulated animals come in contact with on a daily basis. While the bedding and bottom of the enclosures are kept adequately clean, the licensee has not have a cleaning and sanitizing schedule of the bar surfaces that is required to prevent the animals from having continual contact with the dirty surfaces.

The lack of proper cleaning and sanitization of the surfaces in the primates enclosures could be a possible source of health hazards or disease, and increase their contact with pests attracted to the dirty areas.

## **Inspection Report**

Indoor primary enclosures must be sanitized at least once every 2 weeks and as often as necessary to prevent an excessive accumulation of dirt, debris, waste, food waste, excreta, or disease hazard, using one of the methods prescribed in paragraph (b)(3) of this section. However, if the species of nonhuman primates housed in the primary enclosure engages in scent marking, the primary enclosure must be sanitized at regular intervals determined in accordance with generally accepted professional and husbandry practices.

To be corrected by: November 10, 2024

## 3.127(d)

### Facilities, outdoor.

There is a wooden 6ft perimeter fence that surrounds a silver fox in the backyard of the property. The wooden fence has a few 1-2ft holes or gaps at the bottom 2ft due to missing boards on the back/north side of the primary enclosure. There is a section of the old wooden perimeter fence on the west side that is leaning out and away from a newer section of wooden fence causeing a 1.5ft to 2ft gap. There was fencing attached to fix this gap, however the fence in this area is only approx. 5ft in height, instead of the required 6ft. The distance between the north and west side of the perimeter fence and the primary enclosure range from 1.5ft to 2ft and needs to be corrected to the required 3ft, unless a variance is acquired.

The lack of a secure perimeter fence around the primary enclosure could prevent the use of it as a secondary containment area if the regulated animal got out of its primary enclosure, and/or allow other animals access to the primary enclosure causing stress or harm to the enclosed regulated species.

The fence must be constructed so that it protects the animals in the facility by restricting animals and unauthorized persons from going through it or under it and having contact with the animals in the facility, and so that it can function as a secondary containment system for the animals in the facility. It must be of sufficient distance from the outside of the primary enclosure to prevent physical contact between animals inside the enclosure and animals or persons outside the perimeter fence. Such fences less than 3 feet in distance from the primary enclosure must be approved in writing by the Administrator.

To be corrected by: December 29, 2024

This inspection and exit interview were conducted with facility representative, and to the licensee over the phone during and after the inspection.
