The University of Arizona Animal

Type: ROUTINE INSPECTION

Date: 20-FEB-2024

2.33(b)(3) Critical

Attending veterinarian and adequate veterinary care.

At evening check on 23 July 2023, calf #476 on a gastrointestinal disease study was found deceased. Per protocol, calf #476 was infected with the agent of study on 20 July 2023. Records show the animal having worsening clinical signs (severe diarrhea, mild lethargy) at the morning check of 23 July 2023, yet was still suckling and consuming water and milk replacer. Later, at the 12pm mid-day check, records show the animal would not suckle, was dehydrated, was given "500mls SQ fluids" and a veterinarian was not contacted. Per protocol, the clinical observation of a calf not eating required contact with a veterinarian before treatments were to be administered. Failure to update the attending veterinarian on problems of animal health and well-being in a timely manner can result in severe injury or death of an animal. A mechanism of direct and frequent communication is required so that timely and accurate information on problems of animal health, behavior and well-being is conveyed to the attending veterinarian.

Correct from this date forward of 23 February 2024.

3.131(d)

Sanitation.

Multiple piles of rabbit droppings are present on the cement slab next to hay stored at the farm facility where the feedstuff is intended for use in horses, cattle, sheep and a donkey. A facility representative stated the droppings are from wild rabbits and the current pest control program is monitoring but no mitigation. Failure to have an active program to control mammalian pests may result in disease transmission to or illness in animals. A safe and effective program for the control of insects, ectoparasites, and avian and mammalian pests shall be established and maintained.

Correct by 8 March 2024.

This inspection and exit interview were conducted with facility representatives.
