Type: ROUTINE INSPECTION

Date: 18-JUL-2023

2.40(b)(2)

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

The enclosure with two mini-zebus and one goat, inspectors noticed the female zebu had all four hooves overgrown. When questioned the facility representative stated they had scheduled the farrier but had cancelled at the last minute. Overgrown hooves can cause pain, discomfort, and lead to abnormal gaits. The use of appropriate methods to prevent, control, diagnose, and treat diseases and injuries, and the availability of emergency, weekend, and holiday care.

Correct by: August 1, 2023.

3.78(d) Repeat

Outdoor housing facilities.

While walking behind the macaque row enclosures inspectors noticed the top of the perimeter fence detached from the top pipe and bending inwards. Along the same section of perimeter fencing, inspectors noticed top portions unwinding and a large gap forming. The perimeter fence behind the chimpanzee housing had a gap under the fence. The integrity of the perimeter fence is important to minimize stress to the non-human primates from outside people or animals. The fence must be constructed so that it protects nonhuman primates by restricting unauthorized humans, and animals the size of dogs, skunks, and raccoons from going through it or under it and having contact with the nonhuman primates.

3.84(d)

Cleaning, sanitization, housekeeping, and pest control.

Inspectors observed in the empty macaque enclosure one live rat in the night house hanging 10 feet above ground. Mammalian pests carry diseases that can severely affect non-human primates' health and well-being. An effective program for control of insects, external parasites affecting nonhuman primates, and birds and mammals that are pests, must be establish and maintained so as to promote the health and well-being of the animals and reduce contamination by pests in animal areas.
