Inspection Report

Wildlife World Zoo, Inc.

16501 W. Northern Ave Litchfield Park, AZ 85340 Customer ID: 3448

Certificate: 86-C-0117

Site: 001

WILDLIFE WORLD ZOO INC.

Type: ROUTINE INSPECTION

Date: 16-OCT-2024

2.131(c)(1)

Handling of animals.

It was observed that the public may be able to make contact with several animals while they were in their primary enclosures due to absent barrier measures.

The varied height vertical log wall of the African Crested Porcupine enclosure measures 23 to 36 inches tall on the public facing side, allowing the public to reach over the enclosure wall and make contact with the animals. An approximately foot wide depression in the ground is present at the wall base on the animal side of the enclosure, which measures approximately 45 inches from ground to top of tallest log. There are some gaps between the logs that allow the public to stick a hand through.

A section of the wall of the primary enclosure containing 2 Crested Screamers consists entirely of chain link fencing measuring 59 inches tall. There is no public barrier at this section of the fence that prevents the public from having contact with the animals.

The varied height vertical log wall of the 1 Crested Screamer enclosure measures 14 to 43 inches tall on the public facing side, allowing the public to reach over or step over the enclosure wall and make contact with the animal. There are some gaps between the logs that allow the public to stick a hand through.

Failure to provide sufficient distance and/or barriers between the animal and the viewing public may pose a risk of harm to the animal and to the public. A sufficient barrier system must be in place to assure the safety of all animals and the public.

Correct by 7 November 2024.

3.127(c)

Facilities, outdoor.

During the first day of the inspection on 16 October 2024, the primary enclosures of 6 alpacas and 27 fallow deer were flood irrigated, a routine action by the facility to water the landscape and provide cooling measures in hot weather. A facility representative indicated they have the ability to control how much water is released during flood irrigation of primary enclosures. Nearly the entirety of the enclosure for the alpacas was covered in standing water approximately 12 inches deep minimum in most parts. There was one dry area of ground with no shade or shelter approximately 14 feet x 14 feet in size that had a smaller cement pad for hay and feedstuff. The animals were observed to walk through and stand in standing water in order to access shade, shelter, food or drinking water.

Approximately 1/3 of the surface area of the enclosure for the fallow deer was covered in muddy water approximately 6

Inspection Report

inches deep in a patchy and marshy pattern. Due to the irregular collection of water on the ground, the animals were observed to walk through and stand in standing water in order to access shade, shelter, food or drinking water. A majority of the water soaked into the ground when inspected in the afternoon of the next day, for both enclosures. The attending veterinarian indicated the facility has not observed hoof issues related to flood irrigation of enclosures in these animals. Animals that do not have access to dry areas or must wade through water to access resources may experience discomfort, distress or medical issues related to prolonged contact with standing water. A suitable method shall be provided to rapidly eliminate excess water. The method of drainage shall comply with applicable Federal, State, and local laws and regulations relating to pollution control or the protection of the environment.

Correct by 7 November 2024.

3.153(a)

Primary enclosures.

At the time of the inspection there are two open tears, each of approximately four inches in diameter, in the rear-side netting of the enclosure housing one adult vulturine guinea fowl. There are other, larger areas of netting that show evidence of prior damage repaired with metal clips. Enclosures in need of repairs such as these cannot reliably contain the birds inside or prevent the entry of birds and other animals from the outside. Birds could escape or become injured or ill due to entry of outside birds or other animals. A worker was called to make repairs to the open tears when the inspector called attention to them, and this was corrected during the time of the inspection on 16 October 2024. Inside the enclosures containing two adult blue and gold macaws and one adult African gray parrot, there are wooden shelter boxes with peeled paint and many places where the wood is more extensively damaged with broken and/or delaminating plywood. Surfaces that are damaged in such a manner pose a risk of illness or injury to birds because they cannot be readily cleaned and sanitized and may have sharp areas.

The facility must ensure that primary enclosures are designed and constructed of suitable materials so that they are structurally sound and kept in good repair to protect the health of the birds and to contain the birds while restricting the entry of outside animals; additionally, all surfaces which come into contact with the birds must be maintained so they can be readily cleaned and/or sanitized or replaced when worn or soiled.

Correct by 30 October 2024.

3.153(a)(1) Critical

Primary enclosures.

During inspection, it was noted on disposition records that a Golden Taveta Weaver was missing on 23 September 2024. Facility representatives confirmed the outdoor housed bird went missing and was never recovered due to unknown cause. They stated that keepers noticed a snake in the area around the time the bird went missing, but never saw the snake enter the primary enclosure of the bird. The facility reports they inspected the enclosure and found no defects. The metal wire enclosure approximately 8 feet wide x 25 feet long x 7 feet tall sits on packed dirt with no dig barrier at the base. Two areas of erosion at the base of the enclosure were noted by inspectors, approximately 2 inches wide and 4 inches wide each. Failure to maintain primary enclosures in good repair to securely contain birds may result in their serious injury or non-recovery in event of escape.

Primary enclosures must be constructed and maintained so that they contain the birds securely.

Title:	VETERINARY MEDICAL OFFICER		
Received by Title:	Facility Representative		Date: 24-OCT-2024

MANNA INS-0001156728

Inspection Report

Correct from this date forward of 24 October 2024.

3.160(b)

Compatibility and separation

Approximately 4 Common Ostrich in the African Train Ride enclosure have complete feather loss over the rump region exposing bare skin that appears unaffected at time of inspection. Facility representatives and the attending veterinarian acknowledge that birds are plucking feathers from each other and attribute it to normal behavior and seasonal hormonal change. The avian environment enhancement plan of the facility states that feather plucking in birds due to social factors will be addressed. No corrective action was taken by the facility per facility representatives due to considering this normal behavior for female ostrich only herds to display this behavior during breeding season. Failure to address incompatibility among animals may lead to their discomfort, distress or physical harm. Birds may not be housed with other animals, including members of their own species, unless they are compatible, do not prevent access to food, water or shelter by individual animals, and are not known to be hazardous to the health and well-being of each other. Compatibility must be determined in accordance with generally accepted professional practices and by actual observations to ensure that the birds are, in fact, compatible.

Correct by 14 November 2024.

This inspection and exit interview were conducted with the facility representatives.
