Type: FOCUSED INSPECTION
Date: 01-APR-2026

2.38(f)(1) Critical

Miscellaneous.

On January 20, 2026, rabbit 3-3 was euthanized due to injuries it received when it was able to enter the neighboring enclosure of rabbit 3-4 and get in a fight. The wire enclosures have a door between them that is closed with a latch and locked down with a metal clip so that the rabbits cannot lift the latch. There are two tabs protruding from the door latch hardware that are about an inch apart where the metal clip can go. Placing the metal clip in one tab locks the latch in the closed position, while the other tab can lock the latch in an open position and does nothing when the latch is closed. The clip was accidentally put in the open position tab when the door was latched closed. During the night, the rabbit was able to get the unsecured latch open and enter the enclosure of the neighboring rabbit. The rabbits in the study are post-pubertal intact males who can see and interact with each across the wire walls that separate their enclosures and but could be aggressive towards each other if they were not housed individually. When the caretaker arrived in the morning, the door between the enclosures was open and both rabbits were in the same enclosure. There was dried blood and tufts of fur on the floor of the enclosures. Physical exams were performed on both rabbits. Rabbit 3-4 had no wounds and just a bit of blood on hair tips near its tail which was presumed to be from rabbit 3-3. Rabbit 3-3 was anesthetized to evaluate its wounds. Upon examination, the attending veterinarian determined that rabbit 3-3 had a grave prognosis due to the nature of its wounds and it was euthanized. Care must always be taken to ensure animals are handled as carefully as possible to ensure their safety and prevent behavioral stress and physical trauma. Corrections to address the situation had been made by time of inspection.

This inspection and exit interview were conducted with the attending veterinarian.
