Wellington Conservation Center
14990 Palm Beach Point Blvd
Wellington, FL 33414

Customer ID: **329044**

Certificate: **58-C-1207**

Site: 001

Wellington Conservation Center

Type: ROUTINE INSPECTION

Date: 05-MAR-2026

2.134(b)

Contingency planning.

There is no documentation maintained to indicate that an annual review of the contingency plan has been completed. The contingency plan must be reviewed by the facility on at least an annual basis to ensure that it adequately addresses all required contingency-related criteria and that no updates or changes need to be made to the plan such as changes made as a result of any recent unforeseen circumstance or the addition of new species. The facility must maintain documentation of their contingency plan annual reviews including documenting any amendments or changes made since the previous year's review. Correct by March 27, 2026

3.75(e)

Housing facilities, general.

Sliced papaya and honeydew melon used for feeding enrichment were observed stored in a refrigerator without being placed in a leakproof container with a tightly fitting lid. The refrigerator was also observed to be dirty, with dried brown residue and crumbs present on the shelves. Improper storage of food items may affect the nutritive value and palatability of the food. Open supplies of food must be kept in leakproof containers with tightly fitting lids to prevent spoilage and contamination. Correct by: 3/12/2026

3.84(d)

Cleaning, sanitization, housekeeping, and pest control.

The facility does not currently maintain an effective pest control program, as evidenced by the large number of rodent droppings throughout the room housing a black and white ruffed lemur. Rodent droppings were present on the floor and inside the enclosure. Additionally, large numbers of fruit flies were observed in and around the food receptacle. Pests such as rodents and fruit flies may spread disease and contaminate food, surfaces, and animal housing areas.

An effective program for control of insects, external parasites affecting nonhuman primates, and birds and mammals that are pests, must be established and maintained so as to promote the health and well-being of the animals and reduce contamination by pests in animal areas. Correct by: 4/06/2026

Inspection Report

Facilities, general.

The wooden shelter located within an outdoor enclosure housing 5 goats was observed to be in disrepair. The structure was leaning to the right and contained large areas of deteriorated and damaged wood. Failure to maintain housing facilities in good repair can result in injury or harm to the animals. Housing facilities shall be structurally sound and shall be maintained in good repair to protect the animals from injury and to contain the animals within.

3.132

Employees.

At the time of the inspection, only one employee was present to feed animals and clean enclosures for 45 regulated animals. This same employee is also responsible for conducting guided tours on a daily basis. A facility representative stated that there is one volunteer who works approximately two hours per week; however, the facility does not have plans to hire additional staff.

The non-compliances identified during this inspection, as well as those identified on previous inspection reports, are consistent with inadequate staffing levels. Without a sufficient number of adequately trained employees, the facility cannot provide the husbandry practices necessary to maintain the animals in a manner that ensures their health and welfare.

A sufficient number of adequately trained employees shall be utilized to maintain the professionally acceptable level of husbandry practices set forth in this subpart. Such practices shall be under a supervisor who has a background in animal care. Correct by April 6, 2026.

3.153(a)(1)(iv) Critical

Primary enclosures.

Multiple ducks have been found deceased within the same outdoor primary enclosure. On March 27, 2025, a Pekin duck was found deceased in the primary enclosure by a facility representative with wounds consistent with predation. On December 15, 2025, an additional Pekin duck was found deceased in the same primary enclosure with wounds also consistent with predation. Following the initial incident, no modifications were made to the enclosure to restrict other animals from entering. Primary enclosures that do not contain the birds securely and/or restrict other animals from entering can negatively affect the welfare of the birds contained within, such as animals escaping, being preyed upon, injured, etc. Primary enclosures must be constructed and maintained so that they restrict other animals from entering the enclosure. Correct by March 20, 2026.

This inspection and exit interview were conducted with a facility representative.

Additional Inspectors:

KRISTIN NAPOLI, SUPERVISORY ANIMAL CARE SPECIALIST
