Type: ROUTINE INSPECTION

Date: 18-MAR-2026

2.1(b)(2)(ii)

Requirements and application

Online social media photos show members of the public interacting with a young serval at the licensee's facility. A post from a public member (01/18/2026) shows several pictures of at least two public members holding the leash of and petting a young serval. A video (01/21/2026) from the facility's social media page advertises an opportunity to be a "Keeper for a day" and includes a clip of a young child interacting with a young serval. An additional post (01/24/2026) by the facility invites the public to come visit their animals; one of the pictures attached includes one of a very young serval. Another post (02/22/2026) makes reference to the recovery process for a serval that underwent surgery three weeks prior and that the facility identifies as theirs. The licensee explained that the serval is too young to reside in an enclosure by herself so she resides at the home of one of the senior staff members. The licensee's current 3-year license does not have authorization for wild and exotic felines. Not acquiring the correct license designations prior to obtaining restricted animal species can result in animals being held by unauthorized or untrained personnel for the species. Per the regulations, licenses authorize the use of animals subject to subparts A through F in part 3 of this subchapter, except that, for animals subject to subparts D and F, licenses must specifically authorize the use of each of the following groups of animals: Group 5 (baboons and nonbrachiating species larger than 33 lbs.) and Group 6 (great apes over 55 lbs. and brachiating species) nonhuman primates; exotic and wild felids (including but not limited to lions, tigers, leopards, cheetahs, jaguars, cougars, lynx, servals, bobcats, and caracals, and any hybrid cross thereof); hyenas and/or exotic and wild canids (including but not limited to wolves, coyotes, foxes, and jackals); bears; and mega-herbivores (including but not limited to elephants, rhinoceroses, hippopotamuses, and giraffes). A licensee must obtain a new license before using any animal beyond those types or numbers of animals authorized under the existing license.

Correct by April 13th, 2026.

Repeat

Handling of animals.

The facility allowed members of the public to interact with their black and white ruffed lemurs in an unsafe manner. The facility offers various types of public interactions with multiple species of lemurs. The lemurs are trained using verbal recall to return to their primary enclosures when staff deem situations unsafe. Online photos taken by public members dated 01/05/2026 show a white and black ruffed lemur perched on a public member's head and shoulder. A public member can

been seen offering a piece of food over the head of another woman and encouraging the lemur to perch onto the sitting woman's head. Another set of photos posted on 12/23/2025 by a different public member during a "Keeper for a Day" experience show a black and white ruffed lemur held close to the woman's face and being kissed on the back by the public member. Allowing nonhuman primates to perch on or near public member's head and shoulders increases the likelihood of injury to both the animals and the public. Additionally, this type of close contact increases the spread of zoonotic disease. During public exhibition, any animal must be handled so there is minimal risk of harm to the animal and to the public.

3.75(a)

Repeat

Housing facilities, general.

During inspection, APHIS Officials observed non-human primates having access to inappropriate materials. The open top enrichment enclosure on the front of the property had an exposed extension cord running from the power source to the muntjac's den to provide warmth during low temperatures. Access to foreign items such as electrical cords can result in illness or injury to the animals. Housing facilities must be kept in good repair and protect the animals from injury.

3.75(c)(1)(i)

Housing facilities, general.

APHIS Officials identified rust in the transfer tunnels from the primary enclosures for several species of lemurs to the open enrichment enclosure. The most severe rusted area had multiple sharp points created where the metal had disintegrated. APHIS Officials also identified a rusted metal cage panel affixed to the outside of an enclosure housing lemurs. The facility representative stated they explained the panels were formerly used it to attach the fans during the summer. No fan was attached at the time of inspection, and so the lemurs had direct access to the rusted panel. The presence of excessive rust in areas where nonhuman primates have direct access cannot be cleaned and sanitized as required appropriately. Additionally, excessively rusted metal loses its integrity and may create sharp points that pose harm to the animals.

Furniture-type fixtures or objects must be sturdily constructed and must be strong enough to provide the safe activity and welfare of nonhuman primates. Any surfaces that come in contact with nonhuman primates must be free of excessive rust that prevents the required cleaning and sanitization, or that affects the structural strength of the surface.

Correct by March 30, 2026.

3.75(e)

Housing facilities, general.

In the sheltered portion of the squirrel monkeys' area, APHIS Officials identified a bag of Mizzou Primate dry food placed directly on the floor. Upon further inspection, the bag still contained food in it. Additionally, cleaning chemicals had been placed directly next to opened bags of cashews, peanuts and canned chicken on a shelf above the sink area. Storage of food stuff directly near cleaning chemicals poses a cross-contamination hazard that may be harmful when ingested. Additionally, placing open bags of food directly on the floor may expose the food to contamination by pests and make it difficult to allow for effective cleaning practices.

Supplies of food and bedding must be stored in a manner that protects the supplies from spoilage, contamination, and

vermin infestation. The supplies must be stored off the floor and away from the walls, to allow cleaning underneath and around the supplies. Only the food and bedding currently being used may be kept in animal areas, and when not in actual use, open food and bedding supplies must be kept in leakproof containers with tightly fitting lids to prevent spoilage and contamination. Substances that are toxic to the nonhuman primates but that are required for normal husbandry practices must not be stored in food storage and preparation areas but may be stored in cabinets in the animal areas. Any opened food container must be kept in leakproof containers with tightly fitting lids.

Corrected at the time of inspection.

This inspection and exit interview were conducted with the licensee.
