Type: ROUTINE INSPECTION

Date: 23-JUL-2026

3.82(a)

Feeding.

The facility's feed shed currently contains at least three bags of primate food that expired on July 9, 2026. These bags of feed are intended for consumption by the facility's two adult black-and-white ruffed lemurs.

Expired food can have decreased nutritive value and palatability, which can be detrimental to the health of the animals that consume it. Any food fed by the facility must be clean, wholesome, and palatable to the animals. It must be of sufficient quantity and have sufficient nutritive value to maintain a healthful condition and weight range of the animals and to meet its normal daily nutritional requirements.

To be corrected by July 30, 2026.

3.125(a)

Critical

Facilities, general.

The licensee did not maintain an enclosure housing one 4-month-old female capybara in good repair to contain the animal, which resulted in the animal's death. According to facility records, the facility received the young capybara on April 27, 2026. A facility representative stated that they had not expected to receive the animal and did not have a specific enclosure prepared for her, so they placed her in the kangaroo enclosure adjacent to the enclosure housing two adult capybaras. These two enclosures share a fence line that has a chained metal gate connecting them. The facility representative stated that there was a wooden board attached at the base of the fence posts on the kangaroo side which blocked the gap beneath the gate; however, this wooden board was not present at the time of inspection.

According to the facility representatives, on April 30, 2026, animal caretakers found the young capybara deceased in the enclosure of the adult capybaras. The facility believed that the animal fit between the wooden board and the base of the gate in order to get into the other enclosure. During the inspection, the inspector measured the distance between the bottom of the gate and the ground and found a gap that ranged from 5 to 7 inches along the length. When the inspector asked how the gate was usually chained, the facility representative showed the inspector multiple ways, some of which resulted in a gap between where the wooden board would have been and the bottom of the gate. This gap was large enough for the young capybara to get through.

Enclosures with gates that do not close securely and leave gaps large enough for a young animal to fit through are not in

Inspection Report

good repair and can lead to escape, injury, or death. The facility must be constructed of such material and such strength as appropriate for the animals involved. The indoor and outdoor housing facilities shall be maintained in good repair to protect the animals from injury and to contain the animals.

To be corrected from this day, July 24, 2026, forward.

This inspection and exit interview were conducted with facility representatives.
