Certificate: **35-A-0405**
Site: 001
Junior Yutzy

Type: ROUTINE INSPECTION
Date: 03-AUG-2026

2.50(a)(1)

Time and method of identification.

At least four adult dogs in the kennel were not identified by a tag, tattoo, or microchip. Not having an official identification on each dog doesn't allow for APHIS officials to be able to properly track the dogs through the kennel. All adult dogs must be identified by an official tag, tattoo, or microchip. Correct by 9/3/26.

3.11(a) Repeat

Cleaning, sanitization, housekeeping, and pest control.

Feces was accumulating throughout many of the enclosures throughout the kennel. When asked, the licensee stated they haven't been scooped since at least last Saturday (2 days prior). In addition, I observed an excessive accumulation of feces underneath the outdoor part of the enclosures. When asked, the licensee stated he has never cleaned under those enclosures. He stated he has been using this building for approximately five years. The accumulation of feces can contribute to the spread of disease. Excreta must be removed from the primary enclosures daily and must be removed from under the primary enclosures as often as necessary to prevent an excessive accumulation of feces.

3.11(b)(2) Repeat

Cleaning, sanitization, housekeeping, and pest control.

At least two doggy doors had grime built up on them. At least two enclosures (one containing a nursing dog and her puppies) had grime and feces material smeared onto the floor within the enclosure. The licensee wasn't sure exactly when the enclosures were last sanitized but thought it was pushing two weeks and said it may have been more than two weeks. At least two enclosures had feeders that had a grimy buildup near the tops of the insides of the feeders. The licensee stated the feeders haven't been sanitized in the past month and can't actually remember the last time those were sanitized.

Grime built up on the doggy doors and insides of feeders and fecal material smeared onto the floors of the enclosures can contribute to the spread of disease. Used primary enclosures and food receptacles must be sanitized every two weeks or more often as necessary to prevent the accumulation of dirt, debris, excreta, and other disease hazards.

3.11(c) Repeat

Cleaning, sanitization, housekeeping, and pest control.

Inspection Report

Pebbles of food were observed throughout the kennel. One corner in the kennel near where food is stored had an accumulation (pile) of food on the floor. Not sweeping up and keeping the kennel clean and free of food on the ground can attract rodents and other pests and contribute to the spread of disease. All housing facilities must be kept clean to help reduce/eliminate rodents and other pests in the kennels which will in turn help reduce the spread of disease.

This inspection and exit interview were conducted with the licensee.

End of report.
