Type: FOCUSED INSPECTION

Date: 06-MAY-2026

2.40(b)(3)

Direct

Repeat

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

Daily observation of two rabbits to assess their health and well-being is not being done adequately, nor is there direct and frequent communication with the attending veterinarian regarding their health problems. Two rabbits, identified during previous inspections with animal welfare concerns, were found with further progression of unresolved medical issues, as well as new issues that have not been noticed by the licensee, and therefore, have not been re-evaluated by a veterinarian.

- The tan and white rabbit was found in thin body condition hiding in a hutch by itself. Its ribs were easily felt when touching its back or sides. This rabbit was again found with its right ear dropped, and the entire inner surface still coated with thick, layered flaky gray material. This material is also still present below the ear and onto the head but now extends over the back of the neck as well. The skin below the ear and at the back of the neck is hairless and pink with flaking grayish tan crust like material. The skin around the thick material along the edges of the ear is hairless and thickened. The entire ear appeared even further macerated, shrunken, misshaped, and irregular, with marked thickening around the ear canal opening. The left ear canal still has a similarly thick layered gray crusty material extending from the ear canal but now goes up most of the length of the inner ear flap.
- The tan rabbit's left eye was only held partially open upon this inspection with some white and yellowish discharge at the corner as well as some pink skin surrounding the eye. This rabbit again has matted fur over most of its lower back with dry, flaky skin. A large area of dark brown, sticky material was still adhered to the fur in this region. Also, this rabbit is still occasionally shaking its head and has an overall unkempt appearance. Additionally, both ear canals not only contained thick, flaky gray material again, but now in the right ear, it extends up about half way up the inner ear while the left ear still has it at mostly at the ear canal opening.

Failure to identify the worsening of pre-existing health issues and failing to maintain timely communication about those findings with the attending veterinarian can lead to treatment delay, which may negatively impact the health and well-being of the animals.

Each exhibitor shall establish and maintain programs of adequate veterinary care that include daily observation of all animals to assess their health and well-being as well as direct and frequent communication so that timely and accurate information on problems of animal health, behavior, and well-being is conveyed to the attending veterinarian.
