BATTELLE BIOMEDICAL
RESEARCH CENTER

Type: ROUTINE INSPECTION

Date: 26-MAY-2026

3.80(a)(2)(iii)

Repeat

Primary enclosures.

The facility self-reported an incident where, on March 28, 2026, one non-human primate (a *Cynomolgus macaque*) was able to exit its enclosure by pushing out the waste pan and maneuvering through that space. The waste pans are meant to be removeable to facilitate cleaning. The non-human primate was unharmed and was returned to its enclosure without further incident. The staff were able to confirm that the non-human primate left its primary enclosure due no locking mechanisms present on the catch pan. The locking mechanism is a secondary means used by the facility to ensure that the pan could not be removed by the non-human primate after clicking the latch that is adhered to the rack by the rack manufacturer.

Primary enclosures that do not securely contain the animal can lead to animal escapes, stress, or injuries. Animal enclosures must be maintained so that they contain the non-human primates securely and prevent accidental opening of the enclosure, including opening by the animal.

The facility had identified this issue prior to today's inspection. They have developed a system of color coded locks to ensure the locks are properly utilized. Training of employees to this system has been implemented. Lock checks are now required to be documented in electronic data records. Management also developed a rack preparation checklist to be utilized by staff to ensure that racks are functioning as intended for non-human primates. Lastly, management evaluated their inventory of different housing racks for non-human primates for suitability of further use.

This inspection and exit interview were conducted with the facility representatives.
