Type: FOCUSED INSPECTION

Date: 19-JUN-2026

3.125(a)

Facilities, general.

The outdoor housing facilities for the otters and the red foxes had areas in need of repair. A metal drainage cover in the otter enclosure had portions that had broken off creating large openings that posed an entrapment risk. The portion of the enclosure fence for the red foxes facing the public had a section approximately 1ft in length where the wires were distorted and warped from previous fallen tree branch damage. There was at least one section of wire warped in a manner that created a sharp point. Both areas pose a risk of harm through entrapment or injury from sharp points. The outdoor housing facilities shall be maintained in good repair to protect the animals from injury and to contain the animals from injury.

Correct by July 6th, 2026.

3.153(a)(1)

Primary enclosures.

The enclosure for the two Bald Eagles had a 3.5 feet long by 4.0 inch wide gap between the glass window and the pipe holding up the wire frame at the top of the enclosure. The gap created is large enough to allow other animals into the enclosure. Wild animals can introduce pathogens and disease to the facility's flock. The primary enclosure must be constructed and maintained so that they contain the animals securely and restrict other animals from entering the enclosure.

Correct by June 27th, 2026.

3.154(b)

Environment enhancement to promote psychological well-being.

The physical environment for multiple bird species, including bald eagles, ring-neck pheasant, red-tailed hawk, golden eagle, black vulture, great-horned owl and barred owl lacked adequate environmental enrichment. Very limited enrichment was provided through the provision of natural perches, and no additional cage complexity, manipulable objects or foraging and task-oriented feeding methods were observed. A lack of adequate environmental enrichment for these species may negatively affect psychological well-being and could

Inspection Report

result in abnormal behavior. The physical environment in the primary enclosures must be enriched by materials or activities that would provide the birds with the means to express non-injurious species-typical activities. With the attending veterinarian's oversight, the facility must implement species-appropriate environmental enrichments to meet the behavioral and psychological needs of the birds.

Correct by July 18th, 2026.

3.154(c)(4)

Environment enhancement to promote psychological well-being.

The facility does not follow an Environmental Enhancement plan for birds that includes special considerations for individually housed social species of birds that are unable to see and hear birds of their own or compatible species. There is one female Ringneck Pheasant currently singly housed and is unable to see or hear compatible birds. The facility's current enrichment plan is limited to providing natural perches and a natural enclosure setting. Failure to follow a plan for birds requiring special consideration may result in inadequate care in promoting and addressing their psychological well-being. Certain birds must be provided special attention regarding enhancement of their environment in accordance with the instructions of the attending veterinarian.

Correct by July 6th, 2026.

3.155(b)

Feeding

The current food receptacle for the Ring-Necked Pheasant is not located so as to minimize any risk of contamination by excreta and pests. The food receptacle for the pheasant is placed on the floor of their shelter, and was observed to have at least two chipmunks consuming the pheasant's food. One chipmunk was observed standing in the food bowl. The presence of pests around and within the bird's food source poses a risk of disease transmission and contamination. Food and any food receptacles must be located so as to minimize any risk of contamination by excreta, precipitation, and pests.

Correct by July 6th, 2026.

This inspection and exit interview were conducted with the superintendent.
