Tails of the Wild

Type: ROUTINE INSPECTION

Date: 15-APR-2026

2.75(b)(1)

Records: Dealers and exhibitors.

The facility did not have the record of acquisition for one red-ruffed lemur and one wolf at the time of the inspection.

Accurate and complete acquisition and disposition records are necessary to allow for medical and legal tracking of the animals. The facility shall ensure that it makes, keeps and maintains records which fully and correctly disclose the following information concerning all exhibition animals: name and address of person from whom the animal was acquired, their USDA license number or Driver's license number/state, the name and address of the disposition of the animal, the date of acquisition and/or disposition, and the species of the animal. The records shall include any offspring born of any animal while in his or her possession.

To be corrected by April 24, 2026.

3.133 Critical

Separation.

On September 15, 2025, the facility representative discovered a young wolf, "Titan" (approximately 6 months old), deceased. During the inspection, the facility representative disclosed that this wolf pup was having trouble integrating with the pack and that he was "skinny, a runt, and the other wolves tended to pick on him". The facility representative explained that staff would periodically introduce Titan into the primary wolf yard to allow supervised interaction due to his history of not getting along with the other animals. She also stated that Titan was brought to the attending veterinarian the day before she found him deceased and that no necropsy was performed. The attending veterinarian stated the pack never fully accepted Titan into the pack social structure, but he was not brought to her for an examination the day before he died.

APHIS officials received a copy of a text message written by the same facility representative that states, "Kira killed him found him in the yard. I didn't hear them fight at all since we were up by the house and everything Had to be within 30 to 45 min time span." The facility representative was asked to provide additional details regarding this text message. She stated she was upset and couldn't remember exactly the time frame of events. APHIS inspectors conducted a second interview with the licensee and facility representative two days after the inspection. The licensee, who was not present the day Titan died, stated Titan's introduction process was appropriate and minimized any ongoing integration issues.

Inspection Report

Following this interview, the licensee sent a timeline of events that stated that they were aware that there was "occasional social friction with certain individual animals" in the group. This timeline stated that "the introduction process remained slow, supervised, and monitored." However, the document acknowledged that Titan was left alone with the group, unmonitored, "what sounded to be a 'scuffle' " occurred, and Titan was found distressed, subdued, and quiet, and died later that day.

Failure to ensure that animals housed together are compatible, and effectively monitor introductions, can lead to aggression, injury, and stress, which can compromise animal health and well-being.

Animals housed in the same primary enclosure must be compatible, and animals shall not be housed near animals that interfere with their health or cause them discomfort.
To be corrected from this day, April 21, 2026, forward.

3.158(d)

Cleaning, sanitization, housekeeping, and pest control.

There is not an adequate pest control program for the garage building that contains birds and the kitchen. During the inspection, a rodent was seen running behind one of the bird enclosures. There was also an accumulation of rodent feces behind the refrigerator and food bins. While the facility does set traps, it is not effective in managing the rodent population.

Pests, such as rodents, can spread disease and contaminate food, surfaces, and animal housing areas. A safe and effective program for the control of insects, ectoparasites, and avian and mammalian pests must be established and maintained so as to promote the health and well-being of the birds and reduce contamination by pests in animal areas.
To be corrected by April 29, 2026.

This inspection and exit interview were conducted with facility representatives.
