Type: ROUTINE INSPECTION
Date: 26-AUG-2026

3.25(d) Repeat

Facilities, general.

Approximately 4-6 pig enclosures previously used and currently unoccupied guinea pig enclosures containing old bedding and left over animal urine and fecal waste had not been cleaned out. This used bedding and leftover waste contributed to the strong ammonia odor within the facility. The licensee must ensure that all used bedding, food and animal waste are disposed of in a timely manner to minimize pests, disease hazards and odors that can affect the guinea pig's respiratory system and overall health.

3.31(a)(1) Repeat

Sanitation.

An enclosure with two guinea pigs had a build up of organic matter along the interior walls of the enclosure with approximately 10 small gnats flying around. This build up of organic matter can contribute to odors, disease, and pest attraction. This build up must also be removed to allow for sanitization. Licensee must ensure that the primary enclosure is cleaned often enough to prevent accumulations that can cause odors, attract pests or cause disease to the animals.

3.31(c) Repeat

Sanitation.

Approximately 10-20 small flies and gnats were seen to annoy two guinea pigs (flinching and constantly moving) in their enclosure on a wooden shelving unit located above the tortoise enclosure. A full fly strip was present as were two, 2-liter bottles with fly attractant that were half full. The licensee must ensure the pest control program is effective and maintained to prevent pests, stress to the animals, disease hazards, and contamination of food and bedding.

3.50(d) Repeat

Facilities, general.

Within the facility (housing guinea pigs, rabbits, ferrets, chinchillas, hedgehog, a bird and feeder rats/mice) there were 4-6 empty enclosures (containing used bedding and animal waste) that had not been cleaned out. The used bedding and leftover waste are contributing to the strong ammonia odor within the facility. Licensee must ensure that all used bedding, food and animal waste are disposed of in a timely manner to minimize pests, disease hazards and odors that can affect the rabbit's respiratory system and overall health.

Inspection Report

3.125(d)

Repeat

Facilities, general.

The facility does not have a provision for the disposal of animal and food wastes, dead animals and trash. The small, shed-sized facility houses 42 regulated animals plus additional unregulated animals (tortoise, rats, feeder mice and rats) and other husbandry items. Wet, soiled bedding shows urine/excreta that are being produced by a variety and number of animals (chinchilla, rabbit, gerbil, ferret, guinea pig, hedgehog, and a bird), and feeder- animals that are housed (stacked on shelves next to each other) within the same area of the facility producing an irritating odor to the inspector. The ammonia odor was most intense near the door (middle of the facility) and a stacking of feeder rats. Food waste from the tortoise, along with 4-6 previously used, empty enclosures with soiled bedding (containing urine/fecal waste) present on the shelves (from the previous week) also contributed to the ammonia odor and acted as a pest attractant (small flies and gnats) that were seen to annoy the guinea pigs. Improper disposal of animal and food wastes and bedding can cause high levels of ammonia and other odors that can create health diseases and hazards for the animals and attract flies and other pests. Licensee must ensure that the disposal methods in the facility shall be so provided and operated as to minimize vermin infestation, odors, and disease hazards..

3.158(a)(1)

Cleaning, sanitization, housekeeping, and pest control.

Within the facility (housing guinea pigs, rabbits, ferrets, chinchillas, hedgehog, a bird and feeder rats/mice) there were 4-6 empty enclosures (containing used bedding and animal waste) that had not been cleaned out. The used bedding and leftover waste are contributing to the strong ammonia odor within the facility. Licensee must ensure that all used bedding, food and animal waste are disposed of in a timely manner to minimize pests, disease hazards and odors that can affect the bird's respiratory system and overall health.

* To be corrected by: 9/4/26

This inspection and exit interview were conducted with licensee.
