Type: ROUTINE INSPECTION
Date: 04-MAR-2026

2.40(b)(2)

Repeat

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

During the inspection, a facility representative stated they are still only using soap and water to clean the food and water receptacles, without any sanitization. Upon consultation with the attending veterinarian, she stated that food and water receptacles should be cleaned and sanitized routinely for prevention of diseases and was not aware of the continued failure to sanitize. When the veterinarian's instructions are not followed, the provision of veterinary care and/or husbandry may be inadequate or inappropriate. The facility needs to follow the instructions provided by the attending veterinarian and as directed in the written program of veterinary care.

3.125(a)

Facilities, general.

The following indoor facility areas were not kept in good repair within Room 5:

- On inspection, two juvenile ferrets from the top enclosure, within a tier of three, were observed outside and below their enclosure. They had gained access below the plastic mesh floor of the enclosure and were found standing in their plastic waste collection tray. The ferrets were able to raise the plastic mesh floor in such a way that allowed their escape due to the floor not being secure. Corrections were initiated by adding metal rods below the plastic mesh floor to stabilize and hold the floor in place.
- In another enclosure housing one ferret, a plastic shelf tray had fallen from its elevated position and was lying on the enclosure floor, slanted up with the right corner raised, exposing multiple cracks and breaks in the plastic creating sharp points and space (ranging from approximately 1/4" to 1" in width) where a ferret's body part could get entrapped. The plastic shelf was removed during the inspection.

Failure to maintain the enclosures in good repair may allow for escape and/or cause harm to the animals by allowing injury, or discomfort from the exposed sharp points and gaps. The enclosure must be structurally sound and shall be maintained in good repair to protect the animals from injury and to contain the animals.

Corrected during this inspection, and shall remain corrected from March 4, 2026, forward.

3.131(c)

Sanitation.

Housekeeping within the indoor ferret housing room was inadequate in Room 3. The room had brown residue and/or stains running down the walls located behind the towers of the primary enclosures. Discarded feed was found

Inspection Report

accumulating within the wall air conditioning vents. An excess of discarded feed and excrement was found on the floor and within the corners of the room. Discarded feed and/or excrement on the walls and other structures within the rooms housing ferrets may expose the animals to disease hazards, odors, and/or attract pests. The facility shall ensure the housing rooms, including the wall a/c units and their vents, walls, floors, and other structures within the rooms, are kept clean by removing accumulations of feces and spilled feed as necessary to protect the health of the animals and to facilitate husbandry practices.

Correct by: 03/15/2026.

This inspection and exit interview were conducted with facility representatives.
