Misfitland Monkey Rescue
100 Bullock Lane
MOSCOW, OH 45153

Customer ID: **9335**
Certificate: **31-C-0284**
Site: 002
Misfitland Monkey Rescue

Type: ROUTINE INSPECTION
Date: 14-APR-2026

3.75(a) Critical

Housing facilities, general.

Several enclosures at the facility are not adequately protecting the animals from injury or being kept in good repair.

One brown capuchin (Zander) died after gaining access to an electric junction box that was inside the enclosure on 04-April-2026. During daily observations of the animals, the licensee found the primate had gained access to the unused box that contained live electrical wires overnight. The animal was still holding onto the exposed electrical wire when it was found. The electricity was turned off, and the animal was confirmed to be deceased due to electrocution. The licensee determined the capuchin was able to gain access by breaking/manipulating the plastic cover plate that was utilized to prevent the animals from contacting the live electrical wiring. The enclosure houses two other brown capuchins and the junction box had since been covered by a wooden barrier.

One brown capuchin (Gunner) had a ceiling fan that was operating in his indoor enclosure. The enclosure wire walls and an additional tall metal enclosure contained within the primary enclosure allowed the capuchin to climb and be in close proximity to the moving fan blades and could result in injury to the animal. The fan had several broken blades and was oscillating side to side exposing a blue electrical junction box that powered the fan. Additionally, there are several areas with excessive sharp points present in the fine mesh wire in various areas near the entrance and top third of the enclosure.

The outdoor area of an enclosure housing two brown capuchins had areas of disrepair. A large area of the wire mesh is pulling away from the primary enclosure creating many sharp points. Additionally, this exposed area could lead to entrapment of the primates.

Failure to adequately ensure that enclosures are kept in good repair can lead to escape, injury, or death in the primates.

The facility must ensure that housing facilities for nonhuman primates must be designed and constructed so that they are structurally sound for the species of nonhuman primates housed in them. They must be kept in good repair, and they must protect the animals from injury, contain the animals securely, and restrict other animals from entering. Housing facilities for nonhuman primates must be designed and constructed so that they are structurally sound for the species of nonhuman primates housed in them. They must be kept in good repair, and they must protect the animals from injury, contain the animals securely, and restrict other animals from entering. Correct by, 29-April-2026.

Inspection Report

3.75(c)(1)(i)

Housing facilities, general.

The facility is not maintaining the surfaces of housing facilities to be free of excessive rust. The indoor portion of a primary enclosure housing 1 rhesus macaque and 1 java macaque was observed with excessive rust on the wire mesh paneling of the wall of the enclosure. Additionally, the lower horizontal support beam in this enclosure has excessive rust with pitting of the affected area. The non-human primates can come into contact with the rusted surfaces.

Rusted primary enclosure surfaces can lose structural integrity over time and cannot be properly cleaned and sanitized. The licensee must ensure that any surfaces that come into contact with non-human primates are free of excessive rust that prevents the required cleaning and sanitization, or that affects the structural strength of the surfaces. Correct by 29-April-2026.

3.75(c)(2)

Housing facilities, general.

The facility is not adequately maintaining surfaces in housing facilities on a regular basis. The indoor portion of two primary enclosures housing a total of 3 rhesus macaques and a java macaque have multiple areas of peeling paint that exposes the concrete underneath the paint rendering these areas difficult to effectively clean and sanitize. Peeling paint can also be hazardous to the non-human primates if ingested. Additionally, there is an approximately 18 inch x 9 inch area of the ceiling in the primary enclosure housing the rhesus macaque and java macaque that is damaged exposing the raw wood underneath and creating jagged edges that could result in injury to the animals.

Surfaces in non-human primate housing facilities require regular maintenance to keep them in good repair, to allow them to be readily cleaned and sanitized and to protect the animals from injury. All surfaces of non-human primate housing facilities must be maintained on a regular basis. Correct by 29-April-2026.

3.84(a)

Cleaning, sanitization, housekeeping, and pest control.

The facility is not adequately removing excreta and food waste daily from primary enclosures. The indoor portion of two primary enclosures housing a total of 4 brown capuchins and 1 squirrel monkey respectively was observed with excessive food waste and excreta on the floor of the enclosures.

Excreta and food waste left in enclosures can lead to increased disease hazards and attract pests that can be harmful to the animals. The facility must ensure all excreta and food waste is removed from inside each primary enclosure daily. Correct by 29-April-2026.

This inspection and exit interview were conducted with the facility representative.
